

City of Blaine

City Council Workshop

August 12, 2024 | 5:30 PM
Blaine City Hall
10801 Town Square Drive NE
Blaine, MN 55449

AGENDA

NOTICE OF WORKSHOP MEETING

In accordance with the provisions of Section 3.01 of the Blaine City Charter, a Council Workshop meeting is scheduled for the following purpose:

- 1. Call to Order**
- 2. Roll Call**
- 3. New Business**
 - 3.1.** 2024-334 Radisson Hills East Townhomes Concept Review
Sponsors: Sheila Sellman, City Planner
 - 3.2.** 2024-299 Pavement Management Program (PMP) History
Sponsors: Daniel Schluender, Director of Engineering
 - 3.3.** 2024-298 TH65 Bridge Aesthetics
Sponsors: Daniel Schluender, Director of Engineering
- 4. Other Business**
- 5. Adjournment**

Agenda Item # 3.1

Radisson Hills East Townhomes Concept Review

Background

Section 75-31 of City Code requires a concept review to ensure that all subdividers are informed of the procedural requirements and minimum standards of this title, and the requirements or limitations imposed by other city ordinances, plans and/or policies, prior to the preparation of a preliminary plat, all subdividers shall present a concept plan to the zoning administrator prior to filing a preliminary plat. Concept plans for subdivisions proposing 50 or more residential units and utilizing development flex zoning shall be referred to the city council for review. Concept plans being referred to the city council for review shall be reviewed by the city council within 60 days of submission of a concept plan meeting the submission requirements of section 75-31(b). The subdivision concept review and feedback provided by staff, and the city council is advisory in nature does not constitute any form of approval of the project. The city council reserve the right for additional comment and review during the formal preliminary plat application process.

A concept plan application has been made for properties located at 11976 Radisson Road and 11958 Radisson Road. The two subject properties are approximately 9.5 acres total and have existing single family homes on each parcel. The properties are zoned Farm Residential (FR) and guided for Low Density Residential (LDR) development at a density of 2.5-6 units per acre. The applicant's concept plan is for 70 townhomes, which would be 7.3 units/acre for density.

The applicant is proposing 70 townhome units on the two parcels. The 4.93 acre parcel to the northwest has an existing home and is zoned Farm Residential (FR) and guided Low Density Residential (LDR). Existing single family homes are located to the south and zoned Development Flex (DF) and guided LDR, and existing townhomes are located to the southeast and are zoned DF and guided Medium Density Residential (MDR). An existing single family home is located to the east and zoned DF and guided MDR.

The existing tree cover on the west and north sides of the development will be preserved to provide backyard privacy. Additionally, the developer proposes to install a tree line at the rear yards of

townhomes 1-7 to ensure privacy for both new and existing homes.

The applicant is proposing to construct 58 two-story, owner-occupied townhomes and 12 three-story owner-occupied townhomes. The proposed development would include a recreation area that would include a pool and a pickleball court.

In order to develop as proposed, the following approvals are required:

1. The project will require a rezoning from FR to DF.
2. The project will require a land use change from LDR to MDR.
3. The project requires a preliminary and final plat which will include right of way dedication.
4. If the property is rezoned to DF, a conditional use permit will be required which will allow the City Council to review the site and building design and apply conditions if needed.

Staff Recommendation

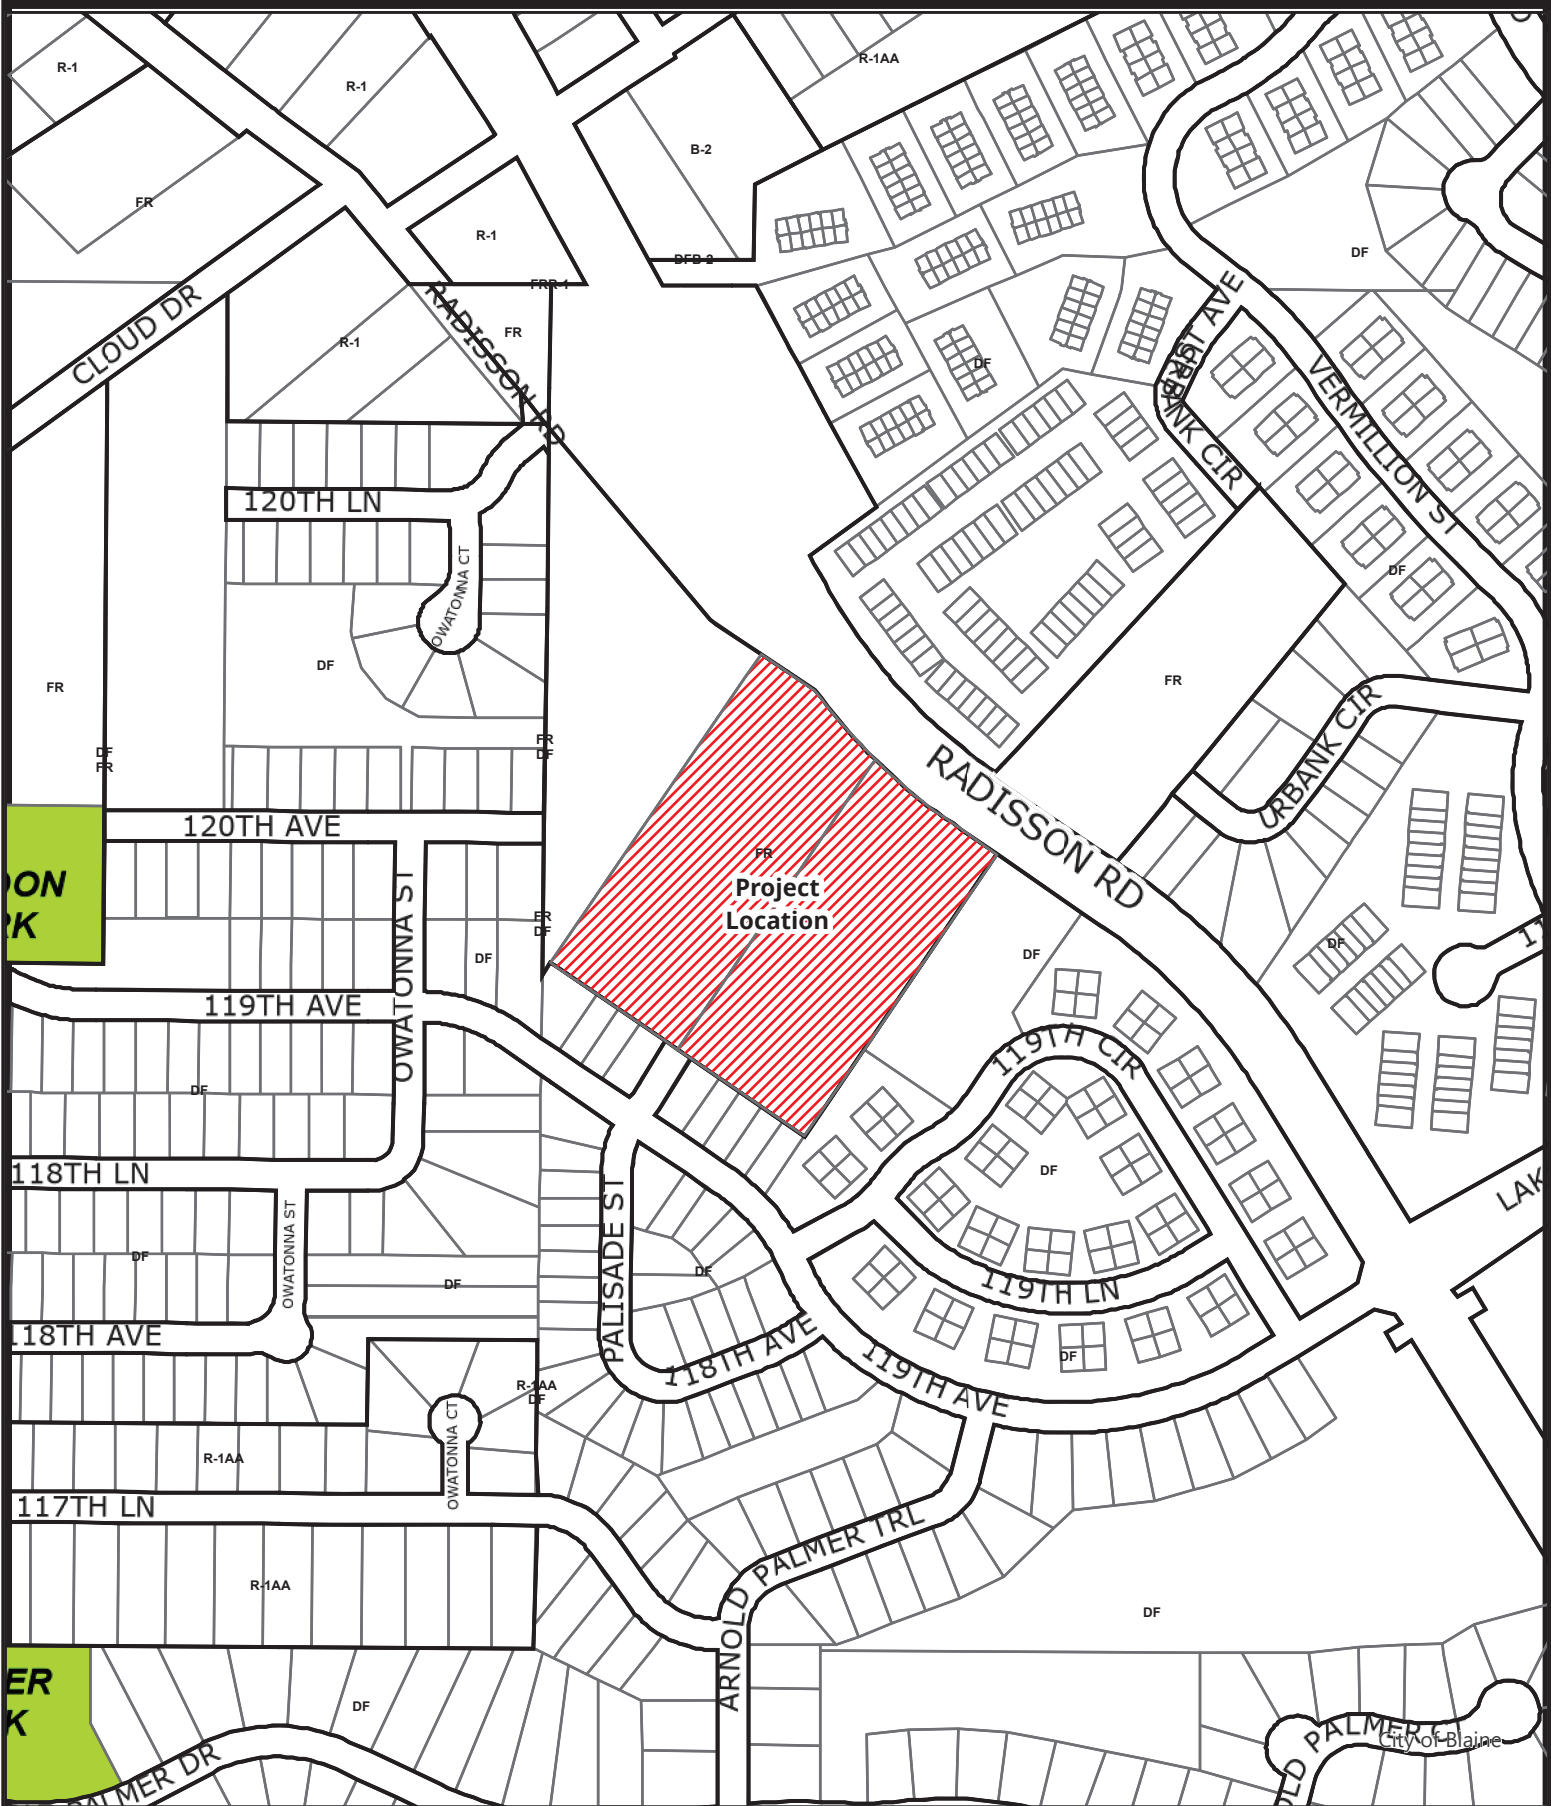

Provide feedback on rezoning, land use change, townhome elevations, and general layout of the proposal.

Questions for Council

1. Does the Council support a land use change to MDR (Medium Density Residential)?
2. Does the Council support a rezoning to DF (Development Flex)?
3. Does the Council have any feedback on the layout of the site and townhome elevations?

Raich Companies

July 25, 2024

Dear members of the City Council,,

Raich Companies LLC is excited to present our proposal for a new townhome development situated on a 9.53-acre site adjacent to medium-density townhomes and off the major highway, Radisson Road. This project aims to enhance the community by offering a high-quality, executive-style living environment while addressing the city's growing need for diverse housing options. We request your approval for this development and an update to the zoning as Dev Flex from Farm Residential to accommodate this vision.

Project Overview

The proposed development will feature 70 individual townhomes with 2-bedroom, 3-bedroom, and 4-bedroom options. Each unit will boast a hardboard exterior and architectural shingles, ensuring an upscale aesthetic that complements the existing neighborhood. The development will be further enhanced by lush landscaping, walking trails leading to a clubhouse, a large pool, and a fenced pickleball court, offering a resort-like experience for residents.

1. **Diverse Housing Options:** This project aims to enhance the community by offering a high-quality, executive-style living environment while addressing the city's growing need for diverse housing options.
2. **Enhanced Aesthetics and Privacy:** The existing tree cover on the west and north sides of the development will be preserved to provide backyard privacy and enhance the natural beauty of the site. Additionally, we plan to install a tree line at the rear yards of townhomes 1-7 to ensure privacy for both new and existing homes.
 - **Ample Parking and Accessibility:** The development design includes ample parking for guests and longer driveways to accommodate larger vehicles. This thoughtful planning ensures convenience and accessibility for residents and their visitors.
 - **Recreational Amenities:** The inclusion of walking trails, a clubhouse, a large pool, and a fenced pickleball court will promote an active lifestyle and foster a sense of community among residents. These amenities are designed to meet the recreational needs of families and individuals, making the development a desirable place to live.
 - **Economic Growth:** By approving this development, the City of Blaine will benefit from increased property values and potential new residents, contributing to the economic growth and vitality of the area.
3. **Community Compatibility:** This project is situated between existing medium-density housing and the major highway, Raddison Road. The proposed medium density housing is compatible with the surrounding land uses and provides the wider range of hosing types and amenities the development flex zoning is intending.
4. **Environmental Considerations:** While the project will impact approximately 8,000 square feet of wetland, we are committed to environmental stewardship. The addition of a pond will help balance the ecosystem, attract local wildlife, and provide a serene water feature for the community.
5. **Public Utilities are Available:** There are existing public utilities stubbed to the property for future development. The proposed development will not impose any undue burden upon the public services
6. **Site Layout Considerations:** The road and utility layout is in such a manner to for a desirable and unified environment and is not detrimental to future land uses. The layout ties into an existing road stub in the south of the property and is stubbed to the west for future development.
7. **City and State Regulations:** This project will be consistent with all other applicable city and state regulations.

Conclusion

We believe this townhome development will be a valuable addition to the City of Blaine, providing high-quality housing, enhancing the local environment, and fostering community engagement. We respectfully request the City Council's approval of this development and the necessary zoning update to medium density or flex. Thank you for your consideration. We look forward to the opportunity to contribute positively to the City of Blaine.

Sincerely,

Nate Raich

Agenda Item # 3.2

Pavement Management Program (PMP) History

Background

The City Council has asked staff to provide information on the history of the Pavement Management Program. Staff have prepared an outline of costs and miles completed per year dating back to 2010, see attached spreadsheet. In that time, councils have approved or initiated over \$112M dollars for the program. Each year the project types have varied, and the improvements have been a combination of Mill and Overlays, Partial Reconstructions, and Full Reconstructions. From 2010 to 2019, the projects were ranked and recommended based on an internal review of streets between the Public Works and Engineering staff that identified the streets that were in the worst condition and were consuming the most maintenance dollars from the budget.

In 2019, council approved a contract with an outside consultant to review the street network and provide a street rating for all streets that the city maintains. That report was then used to rank the streets and staff prepared 5-year Capital Improvement Program to recommend projects from 2019 to 2022. The 2019 report showed that the overall rating of the city streets was 74.

Likewise, council approved a consultant contract in 2022 to review the streets in the network. Staff again used the report to rank the streets and recommend projects for the 5-year Capital Improvement Programs from 2022 to 2025. The 2022 report showed that the overall rating of the city streets was 79, which is considered very good.

Staff has placed a line item in the 2026 budget to review and rate the streets again to assist in the creation of the 2026–2030 Transportation CIP.

Staff Recommendation

Review the Transportation CIP and the project types associated with the street ratings.

Re: Pavement Condition Survey Results and Recommendations Report
Zones 1, 2 and 3
City of Blaine, Minnesota

Dear Mr. Higgins:

We are pleased to present this Pavement Condition Survey Results and Recommendations Report to the City of Blaine. The purpose of our work was to assess the conditions of the City streets, calculate Pavement Condition Index (PCI) scores, and provide recommendations for repair to help with the City's Capital Improvement Planning.

Please see the attached report for a detailed discussion on the field exploration procedures, results, and our recommendations. The report should be read in its entirety.

Thank you for making Braun Intertec your consultant for this project. If you have questions about this report, or if there are other services that we can provide in support of our work to date, please contact Amy Grothaus at 651.487.7014 or agrothaus@braunintertec.com.

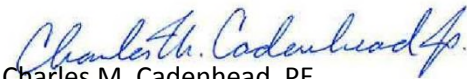

Sincerely,
BRAUN INTERTEC CORPORATION

Map of Recommended Projects

A. Introduction

The City of Blaine's street network is likely one of the largest assets being maintained by the City. Consisting of approximately 260 paved centerline miles, the majority of the streets have a bituminous surface, with a small percentage of concrete surfaced streets. The City also maintains a small amount of gravel streets.

To better manage the paved street network, the City requested that pavement condition surveys be performed. The intent of the surveys was to collect surface distress information, calculate a Pavement Condition Index (PCI) score based on the distresses collected, and then use the information to develop repair recommendations for the streets. Recommended repairs will be used as part of the City's Capital Improvement Planning (CIP) process so that the City can proactively manage the street network.

To perform the pavement condition surveys, the City's streets were divided into three zones as outlined in Table 1 and as depicted in the sketch provided in Appendix A. Streets included in Zone 1, as well as streets identified on the City's 2019 CIP, were surveyed in 2018. Streets included in Zones 2 and 3 were surveyed in 2019.

Table 1: Survey Zones

Survey Year	Zone	Total Surveyed Mileage	Approximate Percent	Zone Description
2018	1	103.5	40%	Between University Avenue (CSAH 51) and TH 65
2019	2	69.0	26%	Between TH 65 and Radisson Road (CSAH 52)
2019	3	87.4	34%	Between Radisson Road (CSAH 52) and Sunset Avenue (CSAH 53)
Total		259.9		

A.1. Background Information and Reference Documents

To facilitate our work, we were provided with or reviewed the following information or documents:

- Sketch indicating the location of the streets to be evaluated, provided by the City
- Aerial Maps available from Google Earth®

- Geographic Information System (GIS) files, provided by the City
- Historical pavement management data, provided by the City in GIS
- Local Road Research Board (LRRB) manual for Flexible and Rigid Pavement Distresses
- ASTM 6433-11 Standard Practice for Roads and Parking Lots.

A.2. Scope of Services

Our scope of services for this project was originally submitted as a Proposal to Mr. Stefan Higgins, dated August 9, 2018. We received authorization to proceed on August 16, 2018. Our scope of services was performed under the terms of our General Conditions dated January 1, 2018. Tasks performed in accordance with our authorized scope of services included:

- Conducting a project kickoff meeting with City staff
- Reviewing available GIS files and associated pavement management data
- Performing pavement condition surveys for all City streets
- Calculating PCI scores for the City streets
- Based on the calculated PCIs, developing a list of maintenance and repair recommendations
- Preparing this report containing results of our evaluation work and recommendations for repair.

B. Review of Available Pavement Management Data

At the onset of the project, two sets of GIS files were provided by the City; one containing street centerlines and one containing the City's pavement management data. The pavement management data set was defined primarily on a block-by-block basis and contained important information related to each street segment, including:

- Unique Road ID
- Street name
- Termini ('from' and 'to' street names)
- Length and width
- Total number of lanes
- Surface type
- Classification (local or Municipal State Aid street)
- Year built
- Year overlaid and/or seal coated
- Bituminous wear course year
- Bituminous and aggregate base layer thicknesses, and
- Curb type.

Also included in the pavement management data set was information related to pavement condition surveys that the City performed in-house between 2011 and 2014.

Towards the completion of the project, the City provided an updated set of GIS centerline files. The GIS files served as the source data for delivery of the project results.

C. Pavement Condition Surveys

C.1. Survey Process

Pavement condition surveys were performed following the ASTM 6433-11 Standard Practice for Roads and Parking Lots. We also referred to the LRRB Flexible and Rigid Pavement Distress manuals, which follow the ASTM procedure, for representative photos of the various distress types.

The ASTM survey process is a highly standardized, objective and repeatable rating methodology that ensures subsequent surveys are performed using the same evaluation criteria. This allows for comparison of the data as subsequent surveys are performed.

GIS maps provided by the City served as a guide to the pavement areas that were to be included in the surveys. Surveys were performed via a manual, walking survey in which 100 percent of the pavement surface area was reviewed and evaluated. Our field evaluator was equipped with a handheld tablet device tied to a Global Positioning System (GPS). Use of the tablet and GPS allowed the rater to visually see their exact spatial location in the field. It also allowed for the creation of GPS-located point data as distress data was collected in the field.

The tablet was pre-populated with pertinent information related to available distress types as per the ASTM rating methodology. All existing distresses were recorded, along with the severity (low, medium, or high) and the quantity (area, linear, or count) of distress.

Surveys for streets in Zone 1 were performed in 2018 along with streets included on the City's 2019 CIP plan, and surveys for streets in Zones 2 and 3 were performed in 2019. Once the surveys were completed, the collected data was compiled and summarized for each unique street segment so that PCI scores could be calculated.

Typically, to properly capture changing pavement conditions, it is recommended that higher volume streets be surveyed every two years and lower volume streets be surveyed every four years. On average, the City should consider subsequent surveys every three years. To ease data collection efforts, one-third of the streets could be surveyed each year.

C.2. Calculation of PCI Scores

For each street segment, based on the distresses collected, a PCI score was calculated. PCI scores range from 0 to 100, where 0 represents a failed pavement and 100 represents a brand-new pavement in excellent condition. Ratings in between reflect current pavement condition and distress levels on a relative scale. PCI scores provide a measure of the present condition of the pavements based on the distresses observed and will provide an objective, rational basis for determining needed repairs. The PCI information can also be used to predict remaining service life and for the scheduling of future repairs.

In general, PCI scores can be categorized as follows. Photographs depicting the various conditions are shown in Photos 1 through 5.

Failed – PCI 0 to 10

Very Poor – PCI 11 to 25

Poor – PCI 26 to 40

Fair – PCI 41 to 55

Good – PCI 56 to 70

Very Good – PCI 71 to 85

Excellent – PCI 86 to 100

Photograph 1 – Jefferson Street, PCI score of 9

Photograph 2 – Lincoln Street, PCI score of 31

Photograph 3 – 111th Avenue, PCI score of 51

Photograph 4 – Washington Boulevard, PCI score of 70

Photograph 5 – Pierce Street, PCI score of 90

While performing the pavement condition surveys, the field raters observed debonding on several of the bituminous paved streets. Photos 6 and 7 provide examples of the debonding that was observed in the field. The debonding depicted in Photo 7 is much more severe and has been patched with bituminous.

Debonding is similar in appearance to the weathering/raveling distress type. However, according to the ASTM rating procedure, weathering/raveling is the progressive disintegrations of the pavement material from the surface downward caused by the loss of asphalt binder and dislodged aggregate particles, indicating that either the asphalt binder has hardened appreciably, or that a poor quality mixture is present. The surface defect occurring in Photos 6 and 7 is not weathering/raveling, but is instead debonding. Debonding occurs when a surface treatment applied to the pavement loses its adherence to the underlying pavement and is stripped from the pavement. Debonding at the surface can occur when

insufficient surface preparation or treatment was performed prior to placement, or when moisture exists within the underlying pavement and then becomes trapped by a seal coat. As that moisture rises to the surface, the surface treatment debonds from the underlying pavement. This pavement defect is not part of the ASTM rating procedure and therefore, was not factored into the calculation of PCI scores.

Photograph 6 – Example of Pavement Debonding

Photograph 7 – Example of Pavement Debonding with Bituminous Patching

C.3. PCI Results

A total of 2,602 street segments were surveyed as part of the project. Once the surveys were complete, the collected distresses for each street segment were compiled. Using the street segment area, the collected information was used to calculate a PCI score for each unique segment. Scores are provided in Appendix B along with available pavement management data for each segment. Scores are also depicted on the color-coded map of PCIs in Appendix C.

Overall, the average area-weighted PCI for the entire street network was a 74, which is considered to be in **very good** condition. Street segments in Zone 1 had an average area-weighted PCI of 68; street segments in Zone 2 had an average of 73; and, street segments in Zone 3 had an average of 83.

Figure 1 provides a breakdown of the total number of segments within each PCI category using the ranges provided above. Figure 2 provides a breakdown of the total miles within each PCI category.

Figure 1 – Pavement Condition Results, Total Number of Segments

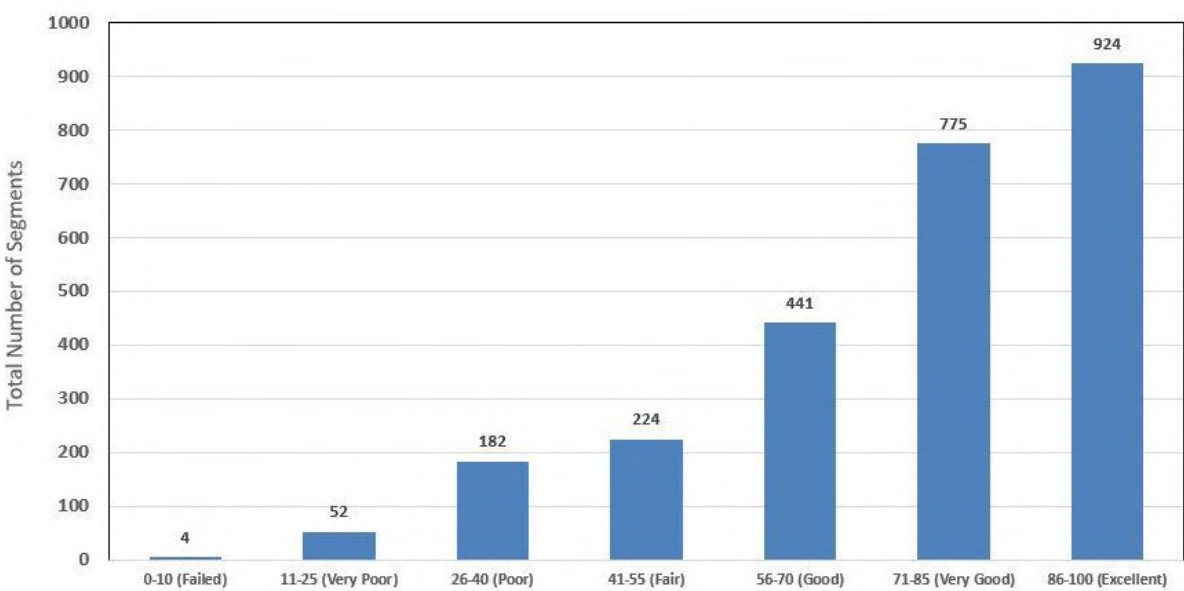

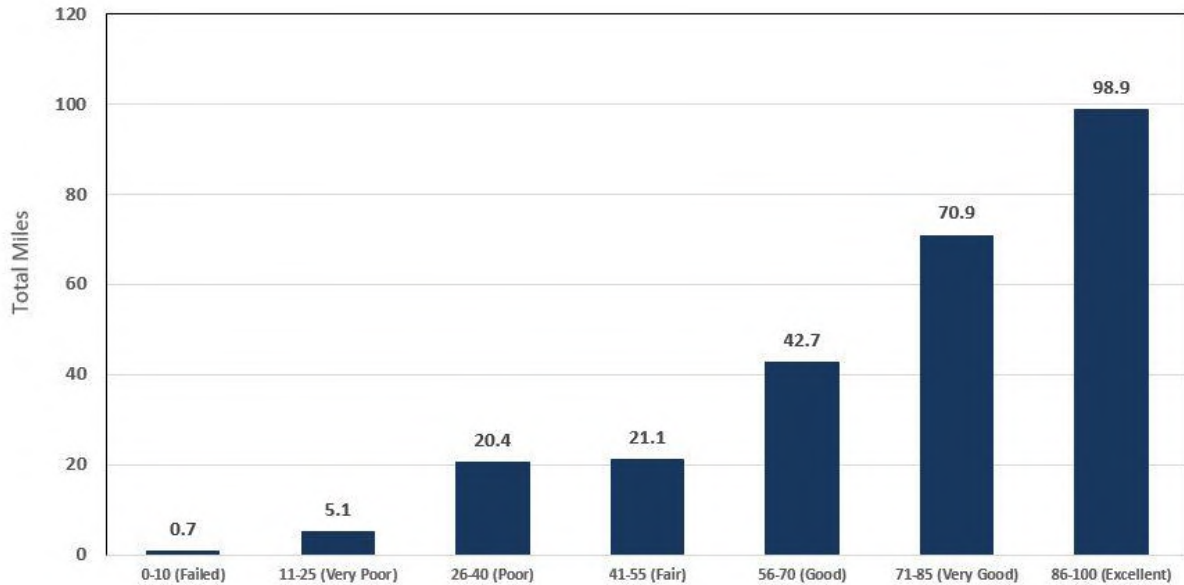

Figure 2 – Pavement Condition Results, Total Miles

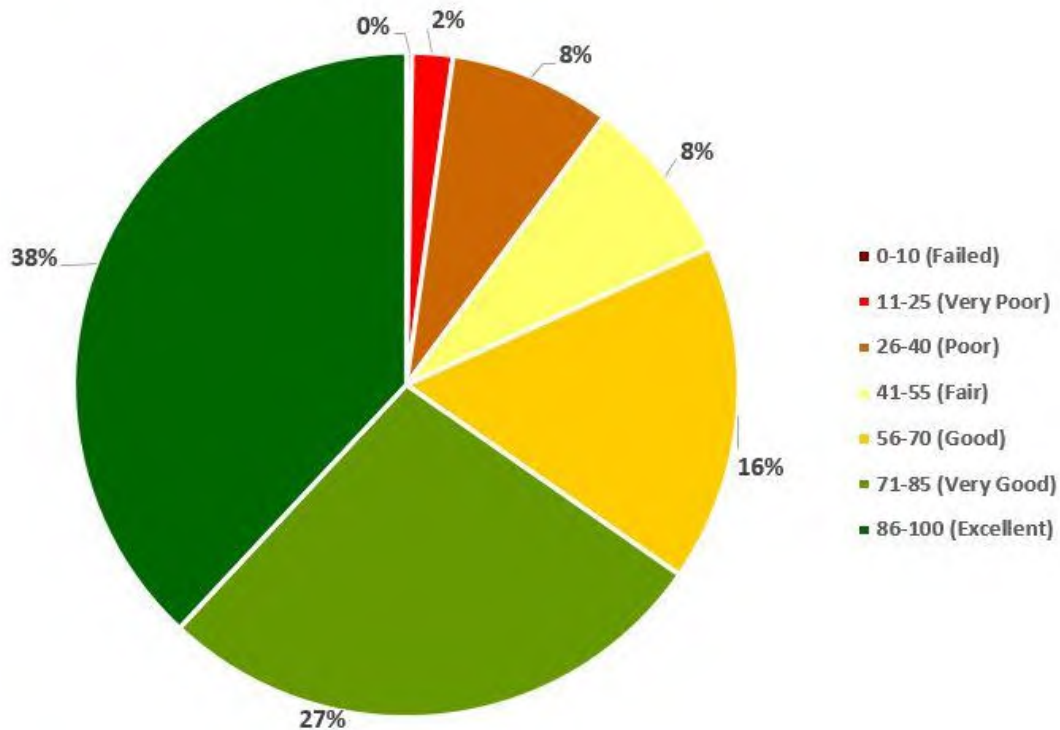

A breakdown of the total pavement length within each condition category is provided in Table 2 and is depicted in Figure 3.

Table 2. Tabular PCI Results

Condition Category	Total Length (miles)	Percent of Total Length
0-10 (Failed)	0.7	0%
11-25 (Very Poor)	5.1	2%
26-40 (Poor)	20.4	8%
41-55 (Fair)	21.1	8%
56-70 (Good)	42.7	16%
71-85 (Very Good)	70.9	27%
86-100 (Excellent)	98.9	38%
Total	259.9	100%

Figure 3 – Breakdown of Mileage, by Percent

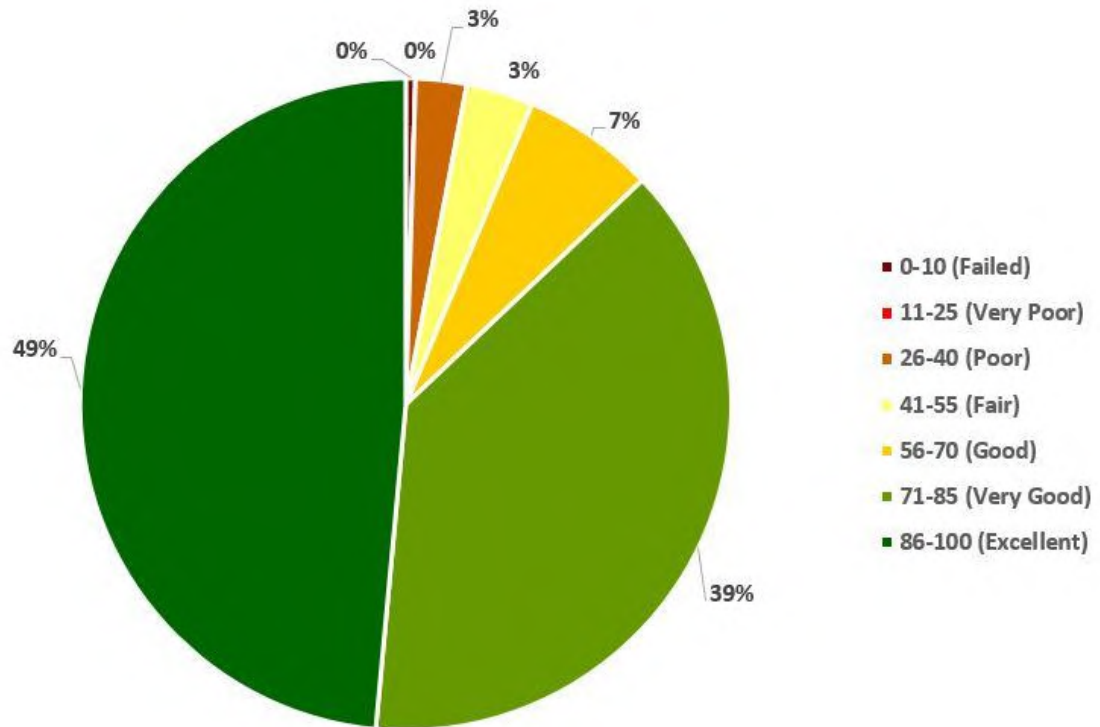

C.4. Historical Surveys

According to the City's pavement management data, pavement condition surveys were performed in-house by the City in 2011 and 2012. Surveys were performed using an internal rating procedure in which 500-feet of each pavement section was evaluated and considered a limited number of distresses, including transverse and longitudinal cracking, block cracking, alligator cracking and rutting.

Scores ranged from 0 to 100 and had an average weighted-by-length score of 82. A breakdown of the condition data from 2011 and 2012 is depicted in Figure 4.

Figure 4 – Historical Condition Data

As is evident in Figure 4, nearly 90 percent of the network was found to be in **very good** or **excellent** condition. This may indicate the internal rating procedure did not give proper weighting to more severe distress types, such as alligator cracking or rutting. It also did not include distresses such as potholes and patching. These types of distresses can largely affect a segment's PCI score. Furthermore, the survey only included a portion of the pavement surface, which likely resulted in certain distresses not being collected.

Moving to the ASTM rating procedure for the surveys performed in 2018 and 2019 allows for a highly standardized, objective and repeatable rating methodology that ensures subsequent surveys are performed using the same evaluation criteria. This will allow for comparisons of the data from year to year, and will allow the City to determine pavement deterioration rates.

D. Project History and Pavement Age

When managing a pavement network and determining appropriate options for maintenance and repair, it is important to not only consider pavement condition, but also pavement age. According to the pavement management data provided by the City, the streets were constructed or reconstructed between 1964 and 2019. Many of the streets have also been overlaid, with the most recent overlay dates ranging from 1992 to 2015. The City also performs seal coating on an annual basis.

Using the last structural improvement year (construction or overlay), the pavement age was determined for each of the street segments, as depicted in Figures 5 and 6. Pavement age is also provided in the table in Appendix B and is depicted on the maps provided in Appendix D. It should be noted that age information was unknown for 7.4 percent or about 19 miles of the pavement network.

Figure 5: Pavement Age, by Percent

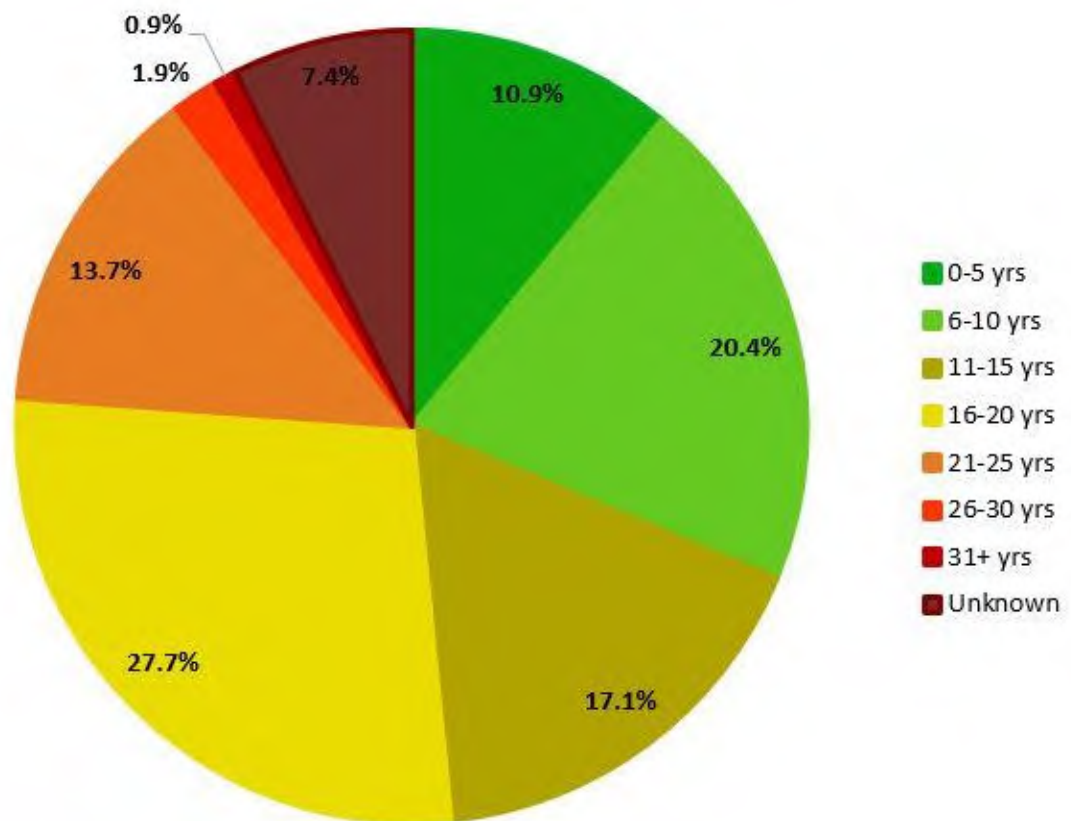

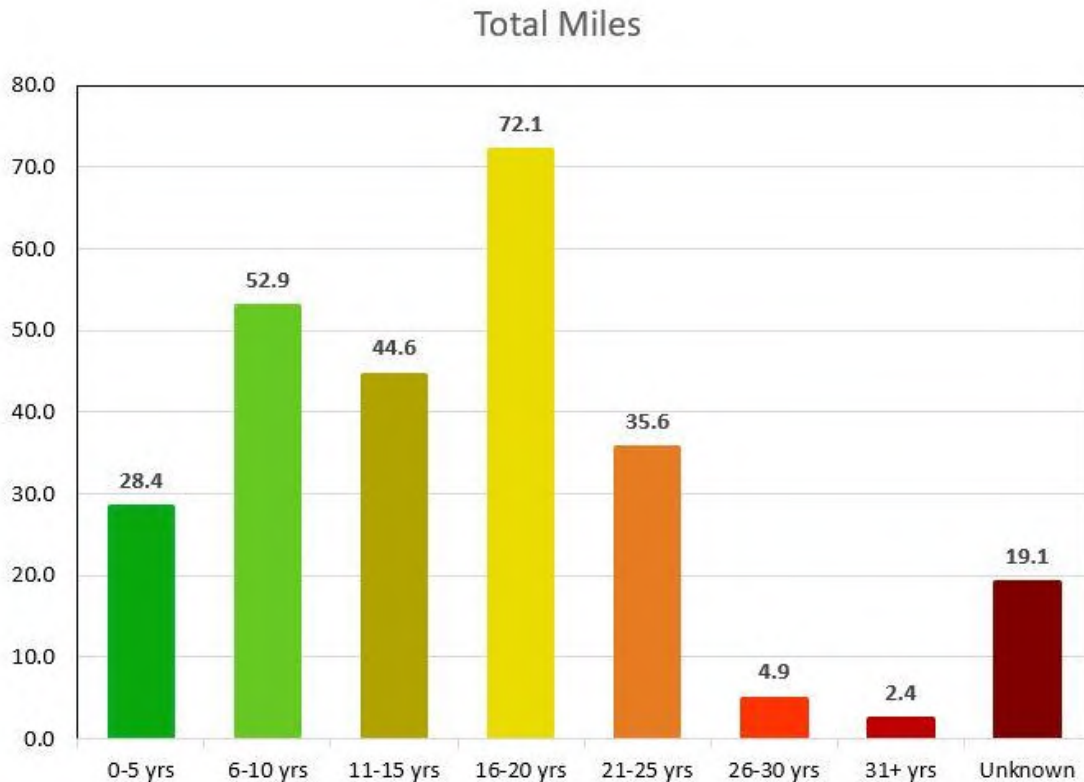

Figure 6: Pavement Age

As is shown in Figures 5 and 6, roughly 31 percent of the pavements have a pavement age of less than 10 years; about 45 percent are between an age of 10 to 20 years, and about 17 percent are more than 20 years old. Age information was not unknown for about 7 percent of the network.

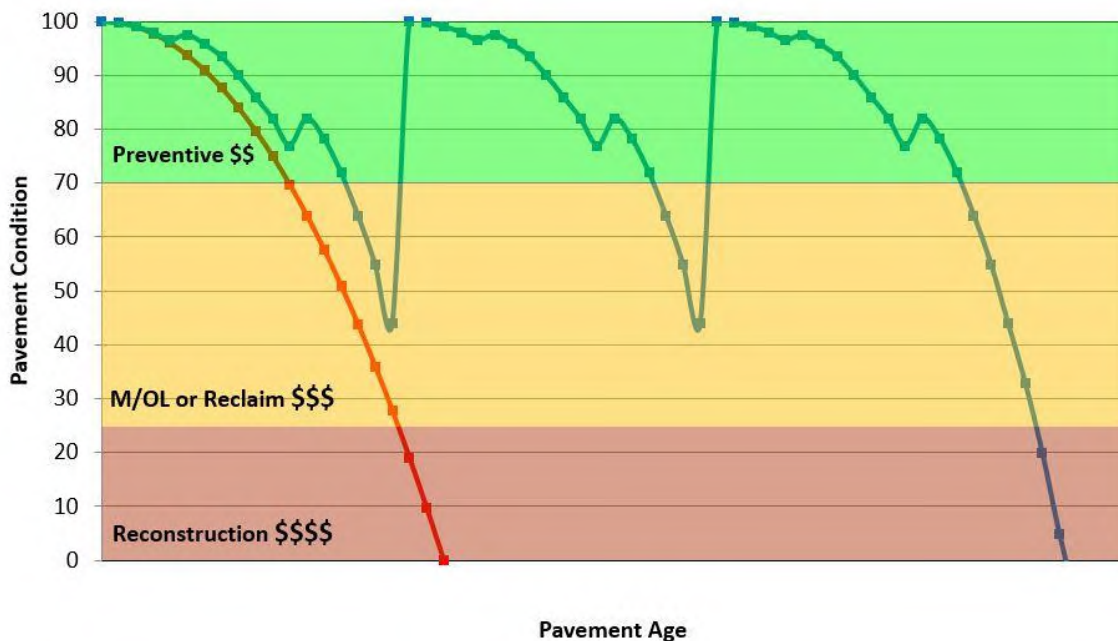

In terms of pavement age data and excluding pavement condition, the age data shown in Figure 6 may indicate roughly 81 miles requires minimal repairs or repairs that are preventive in nature. Preventive repairs, such as crack sealing and seal coating, are generally less costly to perform and keep good condition pavements in good condition. About 152 miles may need some type of major repair, such as a mill-and-overlay or reclamation. Major repairs provide structural benefit and typically “catch” pavements before they deteriorate into worse conditions that may require complete reconstruction. Lastly, about 7 miles may be in need of reconstruction based on an age of more than 25 years.

E. Pavement Life Cycle Curve

As pavements age, conditions deteriorate. The rate at which pavements deteriorate is referred to as a pavement life cycle curve. A typical life cycle curve for bituminous pavement is depicted in Figure 7 by the red curve. At an age of 0, the PCI is a 100. As the pavement ages, the condition deteriorates and eventually reaches a point at which the pavement needs to be replaced. How quickly the pavement reaches that point depends on a number of factors including pavement design, traffic loading, underlying soils, the quality of construction and materials, and how the road is maintained.

To prolong pavement life, maintenance and repair activities need to be performed. These activities are depicted in Figure 7 by the blue curve where both preventive maintenance and major repairs are applied to the pavement at certain conditions to prolong pavement life. A pavement that may have had an original design life of 25 years (represented by the red curve) may be extended up to 60 years by performing timely repairs (represented by the blue curve).

Figure 7 – Typical Pavement Life Cycle Curve

When pavements are in good condition or better (within the green band), preventive repairs such as crack sealing and seal coating should be performed. Based on input from the City, this range included street segments with a PCI of more than 70. Preventive repairs are generally low in cost and help keep good pavements in good serviceable condition. They extend pavement life by sealing open cracks, preventing water and debris from entering the pavement structure and adversely affecting pavement life, and sealing high in-place voids, which may cause raveling and premature potholes.

The yellow band is representative of major repairs, such as mill-and-overlay or reclamation, and includes street segments with a PCI between 26 and 70. Major repairs are more costly than preventive repairs, but provide a much longer added life. These types of repairs restore the pavement surface and provide structural benefit. In the case of reclamation, existing crack patterns are eliminated, whereas reflective cracking will occur with a mill-and-overlay approach.

The most costly repairs occur within the red band and include complete reconstruction when PCIs are below 26.

It is important to note that the PCI ranges represented by the various repair strategies in Figure 7 are to be used as a guide. In addition to the PCI, other factors such as pavement age, underlying bituminous conditions, previous repairs, existing distress types, or the presence of underlying aggregate base will help determine whether or not a certain repair should be performed. For example, when underlying bituminous conditions are deteriorated, mill-and-overlay becomes not as cost-effective since the life provided by the overlay may be shortened. Or, if previous overlays have been performed, reclamation may be necessary to match in-place grades. In any case, it is important that a review of available information is performed along with proper assessment work to ensure the right approach.

Over time, collecting and monitoring changing pavement conditions will allow the City to take a more proactive approach to pavement management by timing preventive maintenance and major repairs that will help prolong pavement life. Expected deterioration rates can also be determined as subsequent surveys are performed.

F. Project Grouping

After the PCI scores were calculated, as previously noted, color-coded maps depicting pavement condition were created and are included in Appendix C. Using available project history data, maps of pavement age were also created, as found in Appendix D.

Using logical geographical proximity, the maps of PCI and pavement age were used to assign each individual street segment to a project group. Project groups included street segments with similar pavement condition and age, and based on input from the City, averaged about 1.6 miles each. A total of 166 groups were created as depicted on the maps provided in Appendix E. Indicated on the maps is the group number and the total mileage for the group.

Assigning street segments to a project group will allow the City to more easily plan their annual CIP. It also provides for efficiencies when it comes to construction costs.

G. Repair Recommendations and Estimated Costs

For each of the 166 project groups, an average PCI was calculated. The average PCI of each group was then used to determine a recommended repair for the group. Repair options were primarily based on PCI although, based on input from the City, other factors were considered such as whether or not a previous overlay had been performed, whether or not concrete curb and gutter exists or is needed, or whether or not the grouping had high severity distresses.

Based on this criteria, each project group was assigned to a repair category; **preventive** if the PCI was a 71 or above, **major repair (mill-and-overlay or reclamation)** if the PCI was between a 26 and 70, and **reconstruction** if the PCI was a 25 or below. The total pavement within each of the three categories is provided in Table 3 and is depicted in Figure 8.

Preventive repairs include maintenance activities such as seal coating. Typically applied early on in the pavement life cycle when the pavement is in rather good condition, these types of repairs help to prolong pavement life while maintaining good condition pavements in good condition. They represent a proactive approach to pavement management.

Major repairs include mill-and-overlay and reclamation. These types of repairs should be performed when a pavement's condition has deteriorated beyond the point of benefitting from a preventive repair. Since a new bituminous overlay is applied with either repair approach, the resulting PCI is a 100. However, for mill-and-overlay, since reflective cracking is likely to occur and since the underlying materials were not replaced, the pavement will deteriorate at a faster rate than if reclamation were performed. Reconstruction repairs may be reactive in nature and are more costly than preventive or major repairs.

Based on information provided by the City, a unit repair cost was determined for each repair type so that total estimated repair costs could be determined as is shown in Table 3. Overall, the total repair need for the pavements, based on current conditions observed in the field and the process outlined above, is estimated to be about \$83 million. Recommended repairs and estimated repair costs are provided in Appendix B and are shown on the map provided in Appendix F.

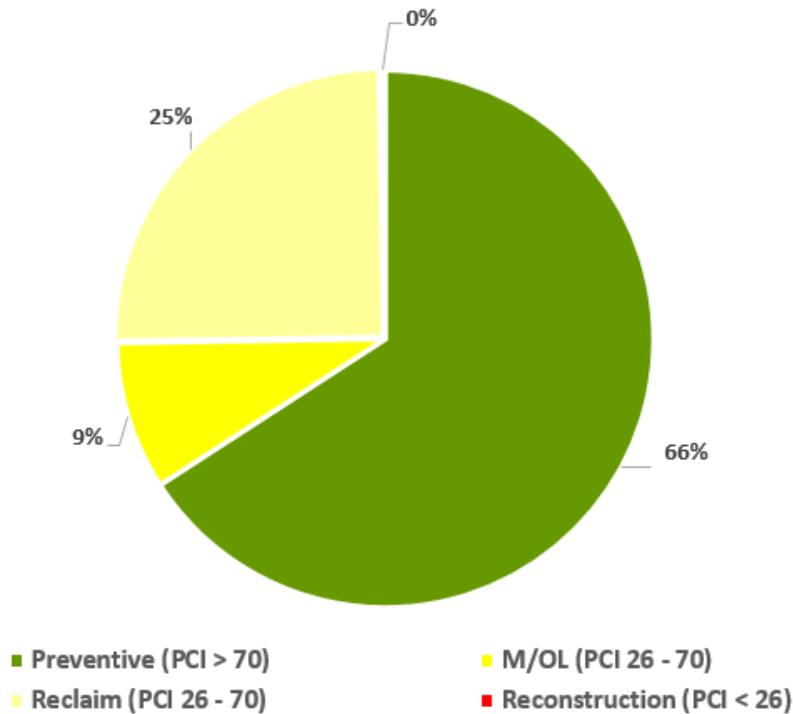

It is important to note that pavements that are currently in the major repair category are at the point at which deterioration begins to occurs more rapidly. If these pavements are not repaired in a timely manner, deterioration into more costly repair ranges will occur rather quickly. As such, it is important that these streets be "caught" before they advance into the lower PCI category.

Table 3. Estimated Repair Costs

	Unit Cost (per linear foot)	Total Linear Feet	Total Miles	Estimated Cost
Preventive (seal coat)	\$4.25	903,391	171.1	\$3,839,412.00
Major Repair (mill-and-overlay)	\$50.00	122,235	23.2	6,111,739.00
Major Repair (reclamation)	\$210.00*	342,811	64.9	71,990,301.00
Reconstruction	\$340.00	3,484	0.7	1,184,614.00
Total			259.9	\$83,126,066.00

*The \$210 per linear foot for 'major repair (reclamation)' represents an average cost for reclamation and various curb replacement options.

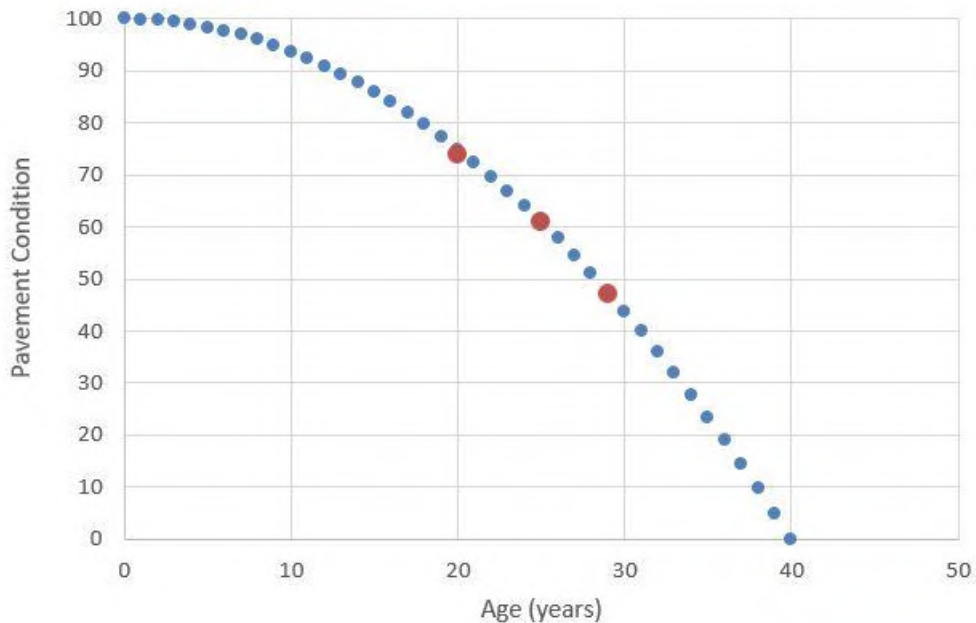

Figure 8 – Repair Needs

H. Future Projections and Final Data Set

To predict future pavement conditions, using a 40-year pavement life cycle curve as shown in Figure 9, the calculated PCIs for each street segment were projected for the next ten years. As previously noted, the current average PCI for the street network is a 74 (shown as the red data point near an age of about 20). If no maintenance or repairs are performed on the City streets over the next five years, the average PCI is projected to be a 61. Ten years from now, the average PCI is project to be a 47.

Figure 9 – Projected Conditions

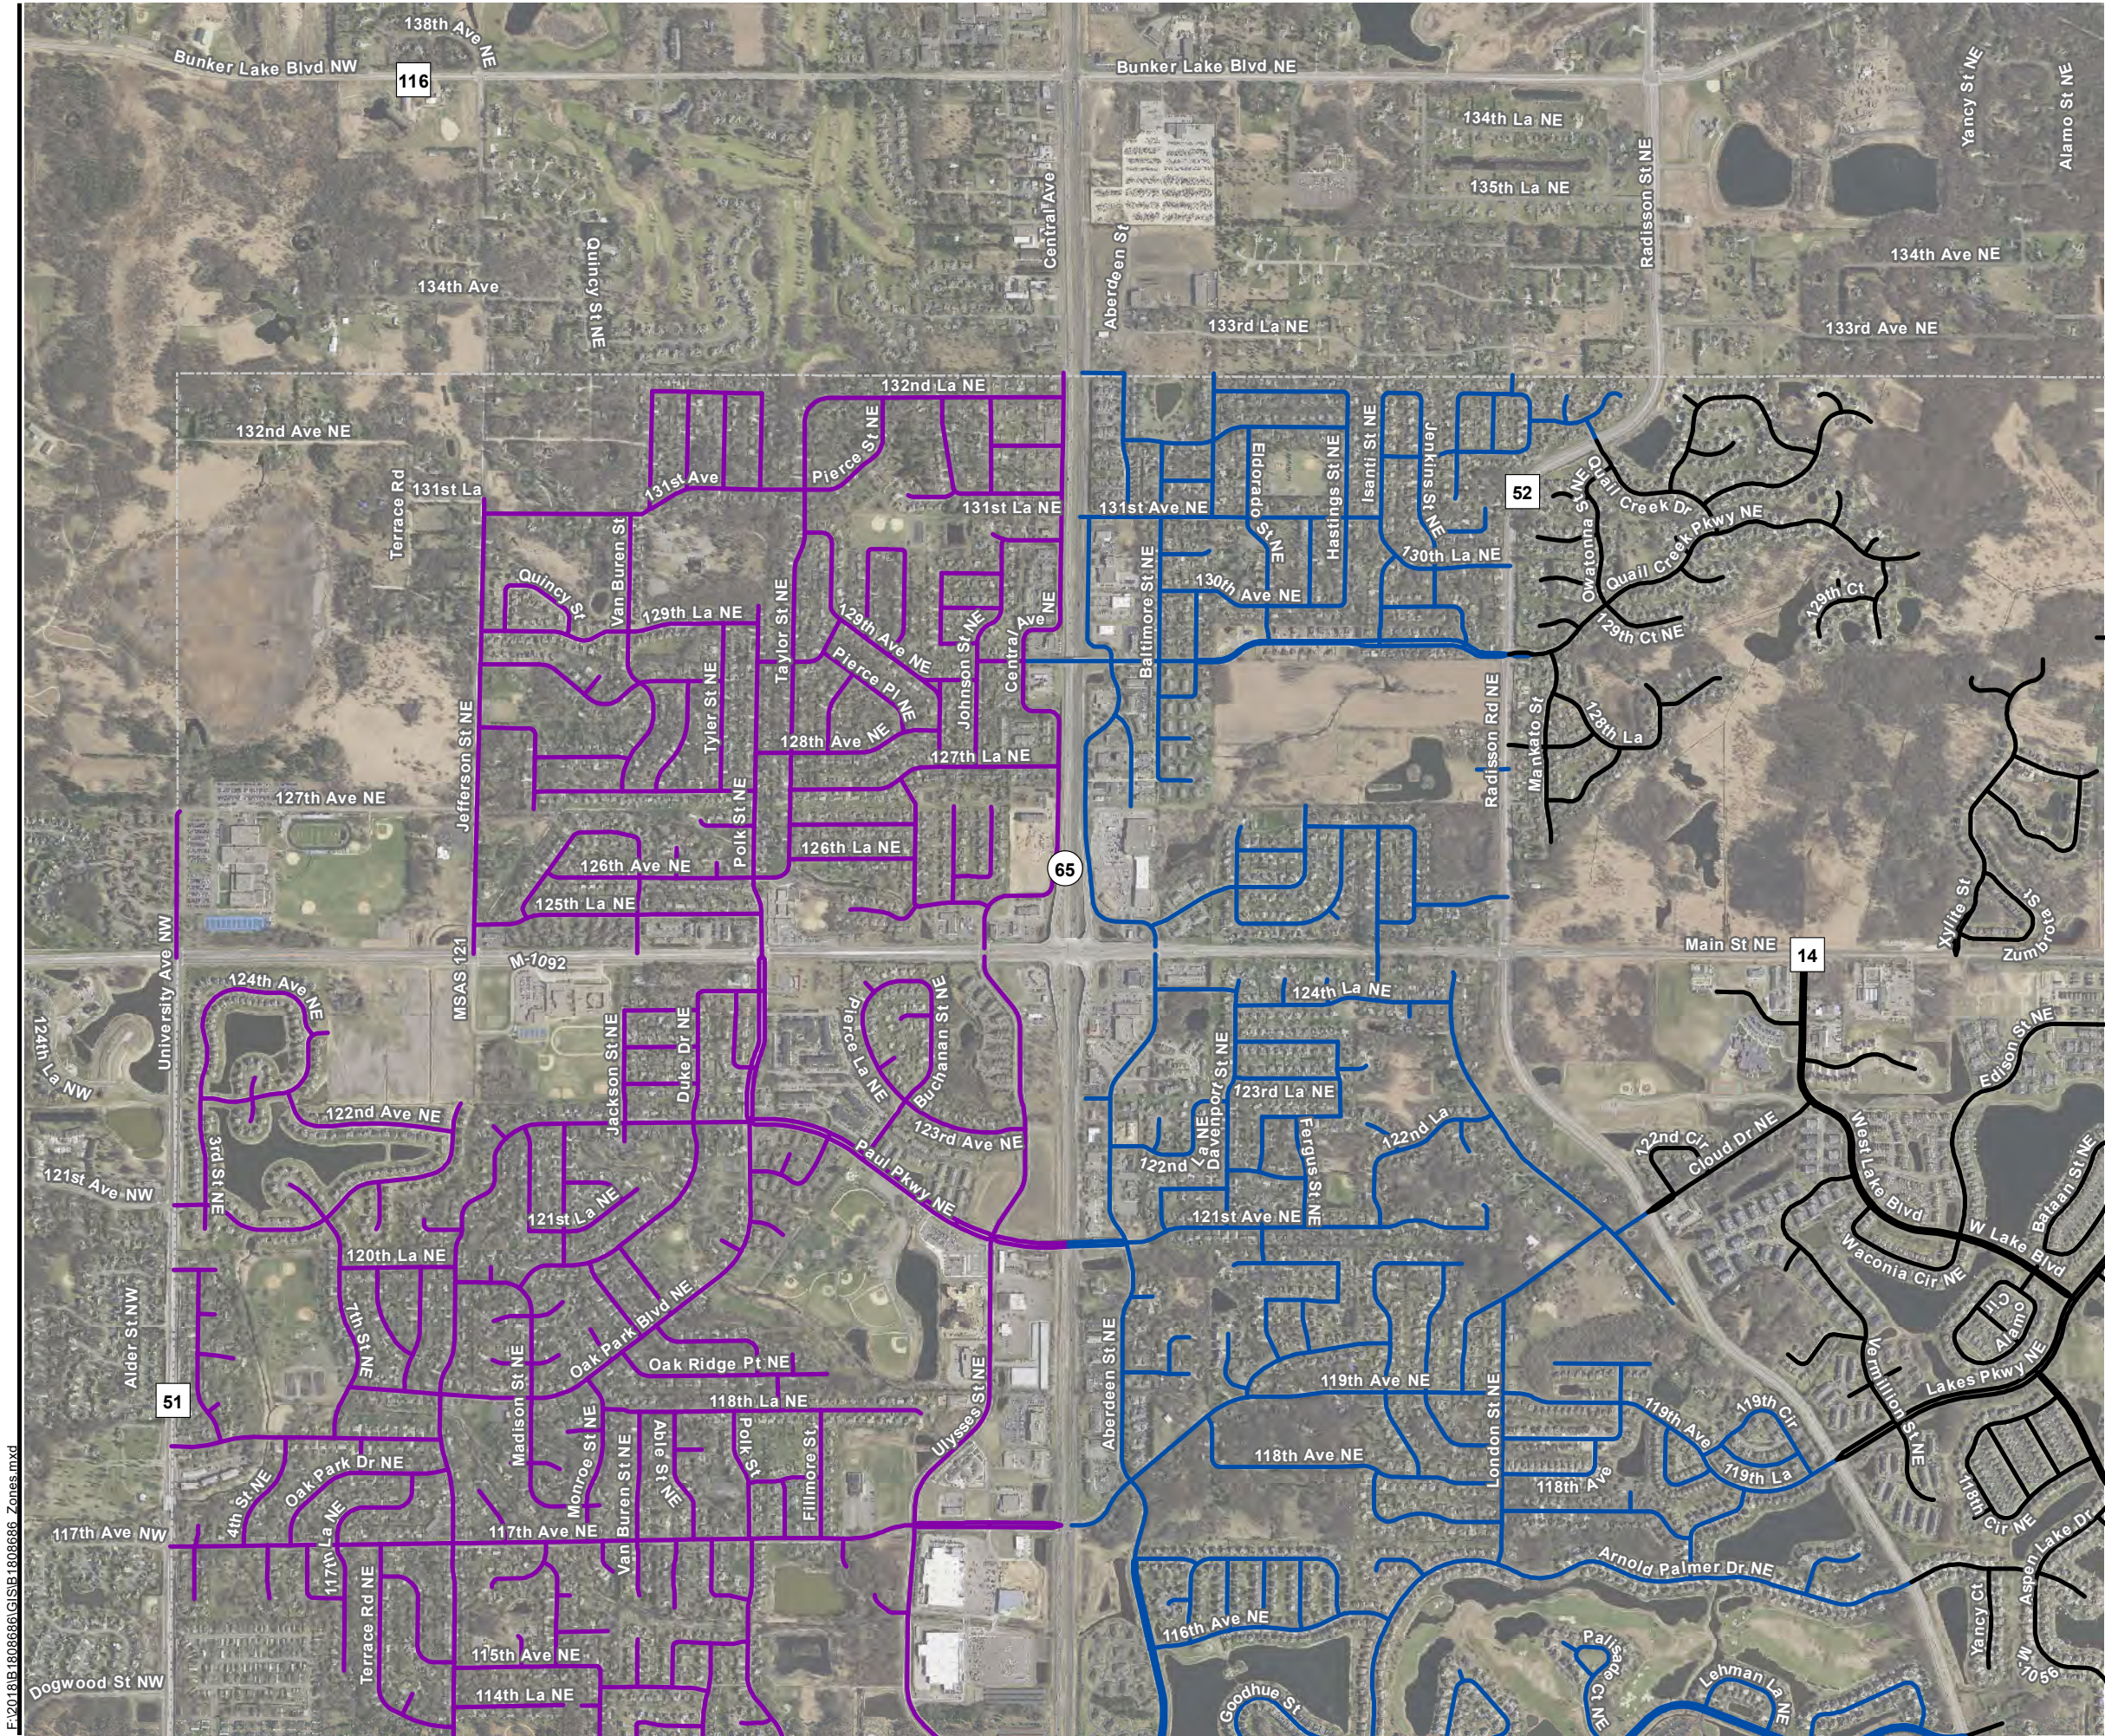

Given the rate at which pavements deteriorate, it is critical that streets receive timely maintenance and repairs so as to prolong pavement life. Included in the final data set provided to the City are the projected PCIs for each street segment for the next ten years. Based on our discussions, we understand the City will be using this information to develop their 5- and 10-year capital improvement plans.

As the City performs future PCI surveys and more data points are obtained, the data can be used to develop customized life-cycle curves for the City's pavements. Curves can be developed based on pavements of similar construction, traffic loading, and soil conditions to better predict future conditions. As an example, major collectors that have been milled and overlaid may be assigned a shorter life-cycle curve than local streets that have been milled and overlaid.

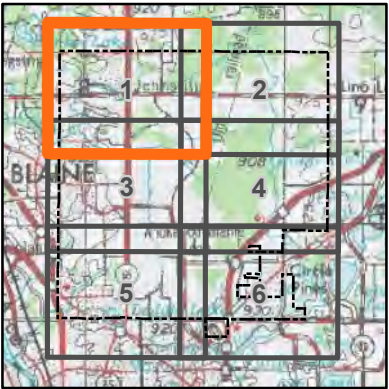

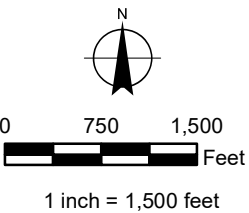

Included with the final report were two GIS map packages containing the City's provided pavement management data and the collected PCI information, as well as the detailed distress information. We assume the City will be maintaining this information within GIS as they continue to proactively manage their pavement network.

Re: Pavement Condition Survey Results and Recommendations Report
City Project No. 22-07
City of Blaine, Minnesota

Dear Mr. Higgins:

We are pleased to present this Pavement Condition Survey Results and Recommendations Report to the City of Blaine. The purpose of our work was to assess and update conditions of the City streets, calculate Pavement Condition Index (PCI) scores, and provide recommendations.

Thank you for making Braun Intertec your consultant for this project. If you have questions about this report, or if there are other services that we can provide in support of our work to date, please contact Amy Grothaus at 651.487.7014 or agrothaus@braunintertec.com.

Sincerely,

BRAUN INTERTEC CORPORATION

Amy J. Grothaus, PE
Account Manager, Senior Engineer

A. Introduction

In 2018 and 2019, Braun Intertec performed pavement condition surveys on the City of Blaine's pavement network. It was requested that we perform updated condition surveys in 2022. The intent of the surveys was to collect updated surface distress information, calculate a Pavement Condition Index (PCI) score based on the distresses collected, and then use the information to develop repair recommendations for the streets.

A.1. Background Information and Reference Documents

To facilitate our work, we were provided with or reviewed the following information or documents:

- Aerial Maps available from Google Earth®
- Geographic Information System (GIS) files, provided by the City
- Historical pavement management data, provided by the City in GIS
- Results from the 2018/2019 pavement condition survey, as performed by us
- Local Road Research Board (LRRB) manual for Flexible and Rigid Pavement Distresses
- ASTM 6433-11 Standard Practice for Roads and Parking Lots.

A.2. Scope of Services

Our scope of services for this project was submitted as a Proposal QTB154071 to Mr. Stefan Higgins, dated February 24, 2022. We received authorization to proceed on March 21, 2022. Tasks performed in accordance with our authorized scope of services included:

- Conducting a project kickoff meeting with City staff
- Reviewing available GIS files and associated pavement management data
- Performing pavement condition surveys for all City streets
- Calculating PCI scores for the City streets
- Based on the calculated PCIs, developing a list of maintenance and repair recommendations

- Estimating repair costs
- Preparing this report containing results of our work, as well as a comparison to the 2018/2019 data.

B. Review of Available Pavement Management Data

At the onset of the project, GIS files were provided by the City. The pavement management data set was defined primarily on a block-by-block basis and contained important information used for the survey including:

- Unique Road ID
- Street name
- Termini ('from' and 'to' street names)
- Length and width
- Surface type

The GIS files served as the source data for delivery of the project results.

C. Pavement Condition Surveys

C.1. Survey Process

As was done in 2018/2019, pavement condition surveys were performed following the ASTM 6433-11 Standard Practice for Roads and Parking Lots. We also referred to the LRRB Flexible and Rigid Pavement Distress manuals, which follow the ASTM procedure, for representative photos of the various distress types. The ASTM survey process is a highly standardized, objective and repeatable rating methodology that ensures subsequent surveys are performed using the same evaluation criteria. This allows for comparison of the data as subsequent surveys are performed.

GIS maps provided by the City served as a guide to the pavement areas that were to be included in the surveys. Surveys were performed via a manual, walking survey in which 100 percent of the pavement surface area was reviewed and evaluated. Our field evaluator was equipped with a handheld tablet device tied to a Global Positioning System (GPS). Use of the tablet and GPS allowed the rater to visually see their exact spatial location in the field. It also allowed for the creation of GPS-located point data as distress data was collected in the field.

The tablet was pre-populated with pertinent information related to available distress types as per the ASTM rating methodology. All existing distresses were recorded, along with the severity (low, medium, or high) and the quantity (area, linear, or count) of distress.

Once the surveys were completed, the collected data was compiled and summarized for each unique street segment so that PCI scores could be calculated.

C.2. Calculation of PCI Scores

For each street segment, based on the distresses collected, a PCI score was calculated. PCI scores range from 0 to 100, where 0 represents a failed pavement and 100 represents a brand-new pavement in excellent condition. Ratings in between reflect current pavement condition and distress levels on a relative scale. PCI scores provide a measure of the present condition of the pavements based on the distresses observed and will provide an objective, rational basis for determining needed repairs. The PCI information can also be used to predict remaining service life and for the scheduling of future repairs.

In general, PCI scores can be categorized as follows.

Failed – PCI 0 to 10

Very Poor – PCI 11 to 25

Poor – PCI 26 to 40

Fair – PCI 41 to 55

Good – PCI 56 to 70

Very Good – PCI 71 to 85

Excellent – PCI 86 to 100

C.3. PCI Results

Once the surveys were complete, the collected distresses for each street segment were compiled. Using the street segment area, the collected information was used to calculate a PCI score for each unique segment. Scores are provided in Appendix A along with available pavement management data for each segment. Scores are also depicted on the color-coded map of PCIs in Appendix B.

Overall, the average area-weighted PCI for the entire street network was a 79, which is considered to be in **very good** condition. In 2019, the average area-weighted PCI was 74. Figure 1 provides a breakdown of the total number of segments within each PCI category using the ranges provided above. Figure 2 provides a breakdown of the total miles within each PCI category.

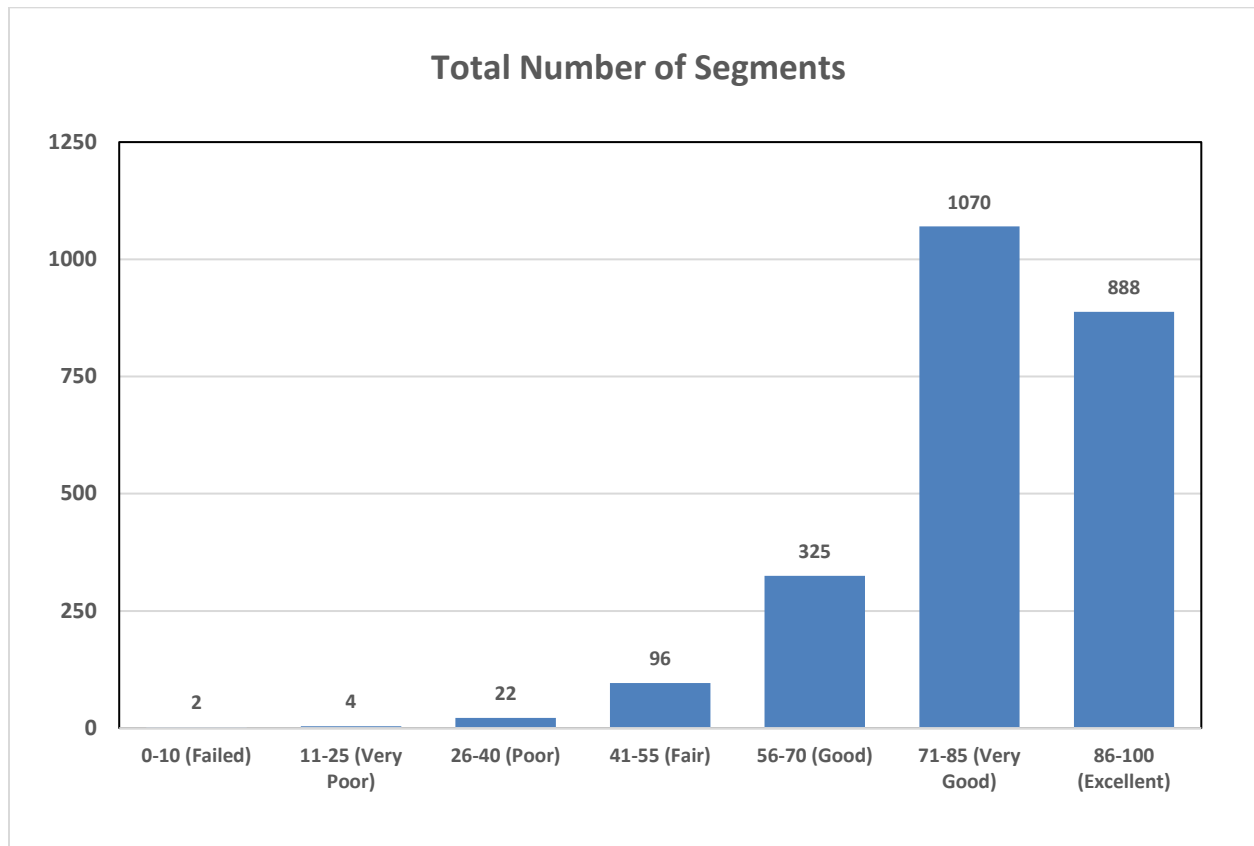

Figure 1 – 2022 Pavement Condition Results, Total Number of Segments

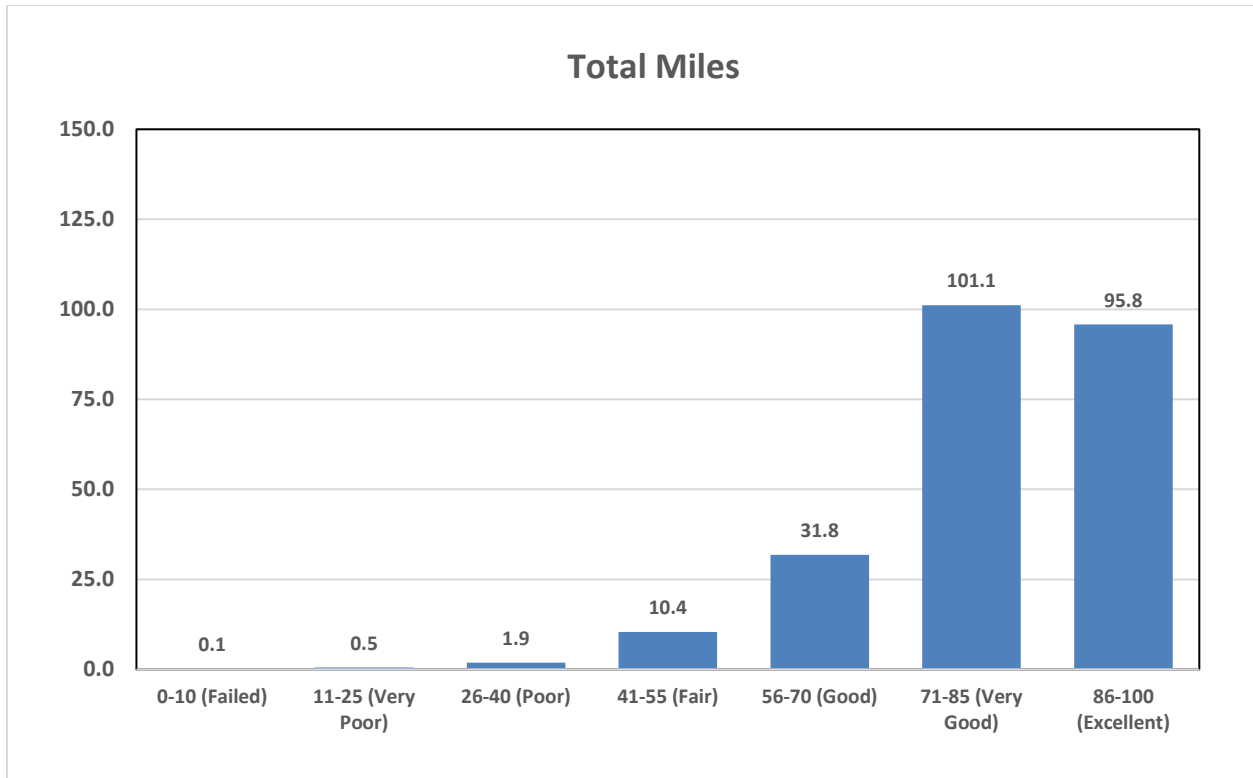

Figure 2 – 2022 Pavement Condition Results, Total Miles

C.4. Comparison of PCI Surveys

As previously noted, Braun Intertec performed condition surveys in 2018/2019. Prior to that, pavement condition surveys were performed internally. The internal rating procedure evaluated 500-feet of each pavement section and considered a limited number of distresses, including transverse and longitudinal cracking, block cracking, alligator cracking and rutting.

Moving to the ASTM rating procedure in 2018/2019 allowed for a highly standardized, objective and repeatable rating methodology that ensures subsequent surveys are performed using the same evaluation criteria. This allows for comparisons of the data from year to year. Figures 3 and 4 include the 2018/2019 survey data.

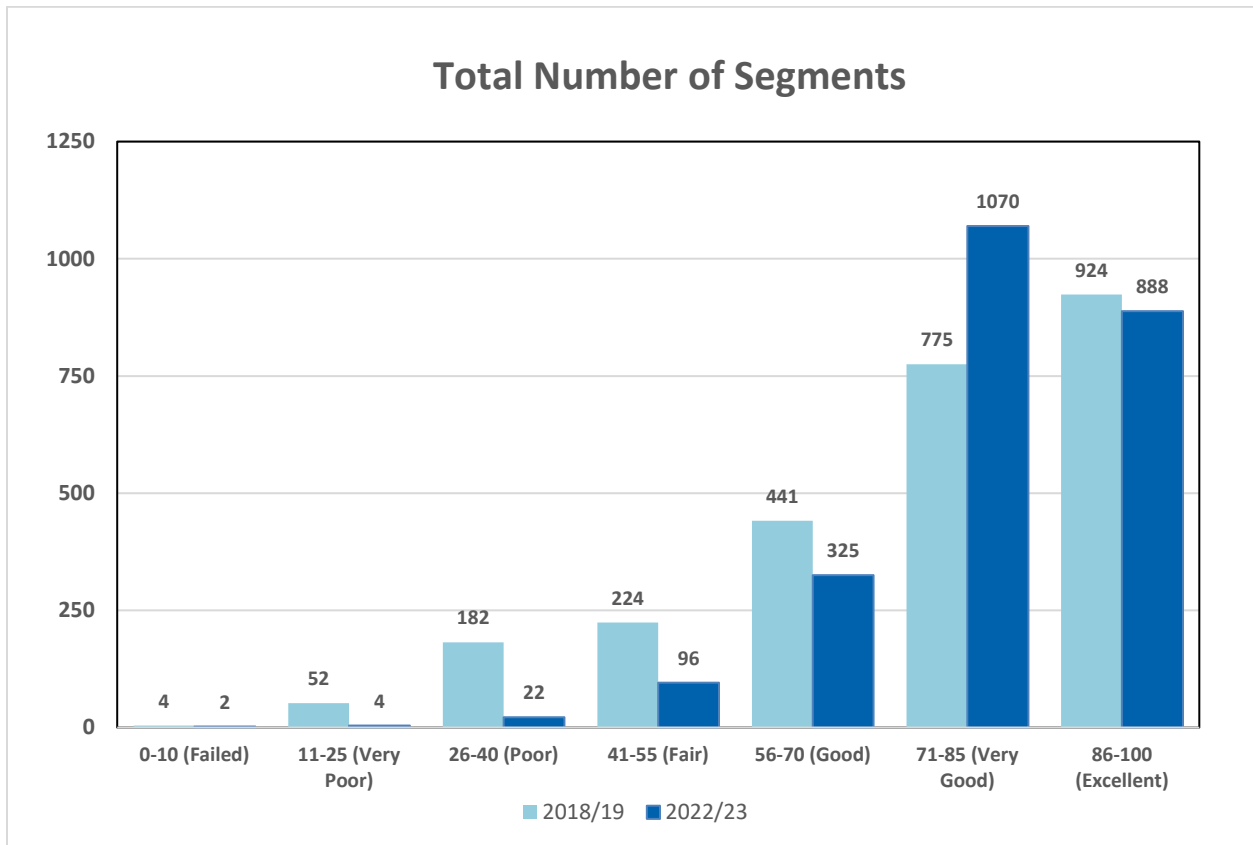

Figure 3 – 2022 and 2018/2019 Data – Total Number of Segments

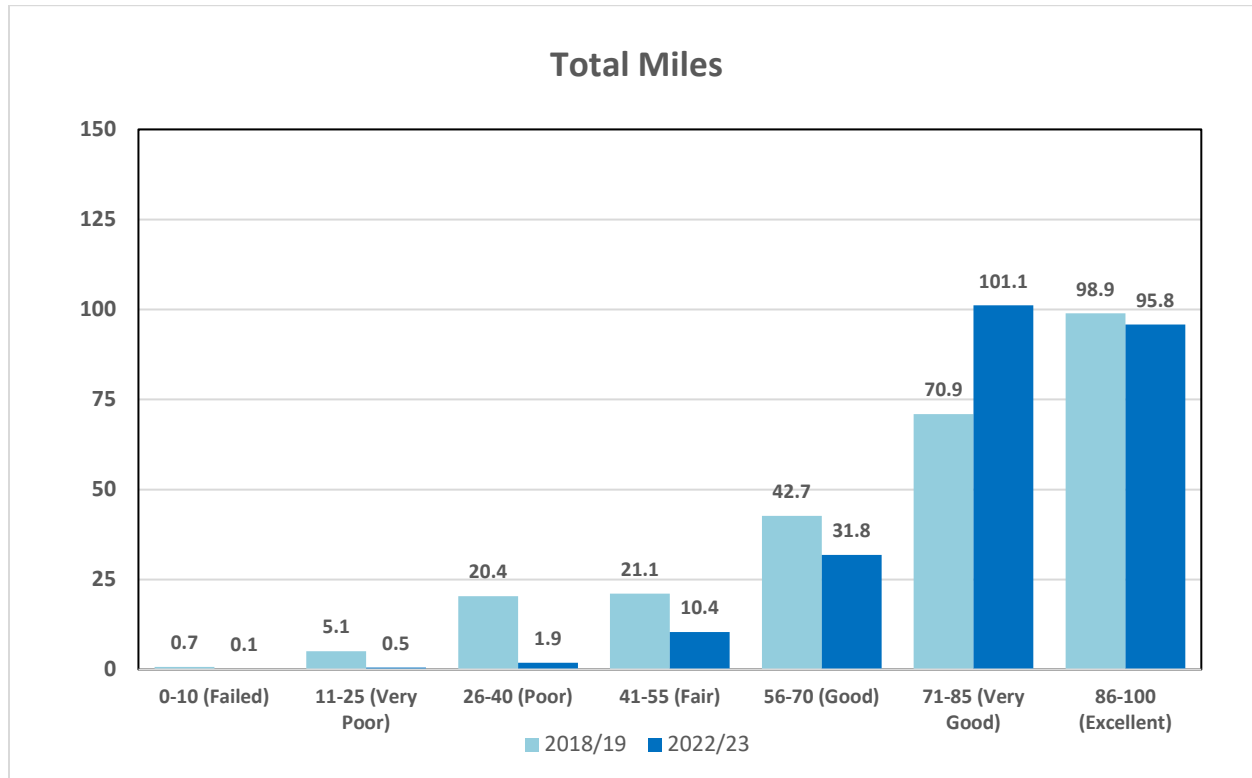

Figure 4 – 2022 and 2018/2019 Data – Total Miles

As noted, since the previous survey was performed, the overall weighted average PCI has increased by 5 points. Based on our discussions, we understand the City has implemented a number of changes to the ways in which the system is maintained, including:

- Streets are no longer seal coated due to the effects of snow plowing
- With the removal of the seal coat program, funding for crack sealing has been increased
- Mill-and-overlays are no longer performed. Instead, the City has moved to full-depth reclamation (FDR) for streets in need of major repair.

These changes have likely affected the PCI scores. The FDR repair completely disrupts existing crack patterns, eliminating the potential for reflective cracking which often occurs rather quickly once mill-and-overlay is performed. FDR also provides a much longer repair life as compared to mill-and-overlay. Both factors result in the delayed development of cracking, which affects a PCI score. Additionally, although seal coating “fills” cracks in the pavement, snow plowing practices that scrape off the seal coat likely led to open cracking and surface wear/loss, which negatively affect the PCI score. With added

funding for crack sealing, cracks are likely being filled sooner and more often. Any filled crack is considered to be low-severity, which generally has a rather low overall effect on a segments PCI score.

It should also be noted that other factors may have resulted in the increased average, including new streets that may have been added to the pavement network and/or an increased amount of funding dedicated to street maintenance and repair.

D. Repair Recommendations and Estimated Costs

The calculated PCI was used to determine a recommended repair for each segment; ***preventive (seal coating and patching)*** if the PCI was a 71 or above, ***major repair (reclamation)*** if the PCI was between a 26 and 70, and ***reconstruction*** if the PCI was a 25 or below. The total pavement within each of the three categories is provided in Table 3 and is depicted in Figure 5.

Preventive repairs include maintenance activities such as seal coating. Typically applied early on in the pavement life cycle when the pavement is in rather good condition, these types of repairs help to prolong pavement life while maintaining good condition pavements in good condition. They represent a proactive approach to pavement management.

Major repairs include reclamation which is performed when a pavement's condition has deteriorated beyond the point of benefitting from a preventive repair. Since a new bituminous overlay is applied, the resulting PCI is a 100. Reconstruction repairs may be reactive in nature and are more costly than preventive or major repairs.

Based on information provided by the City, a unit repair cost was determined for each repair type so that total estimated repair costs could be determined as is shown in Table 1. Overall, the total repair needs for the pavements, based on current conditions observed in the field and the process outlined above, is estimated to be about \$68 million. Recommended repairs are show on the map provided in Appendix C.

Table 1. Estimated Repair Costs

	Unit Cost (per linear foot)	Total Linear Feet	Total Miles	Estimated Cost
Preventive (crack sealing/patching)	\$4.25	1,039,917	196.95	\$4,419,647.00

Major Repair (reclamation)	\$265.00*	232,971	44.12	\$61,737,316.00
Reconstruction	\$410.00*	3,339	0.63	\$1,368,990.00
Total			241.71	

*The cost provided represent the average 2022 costs for repair.

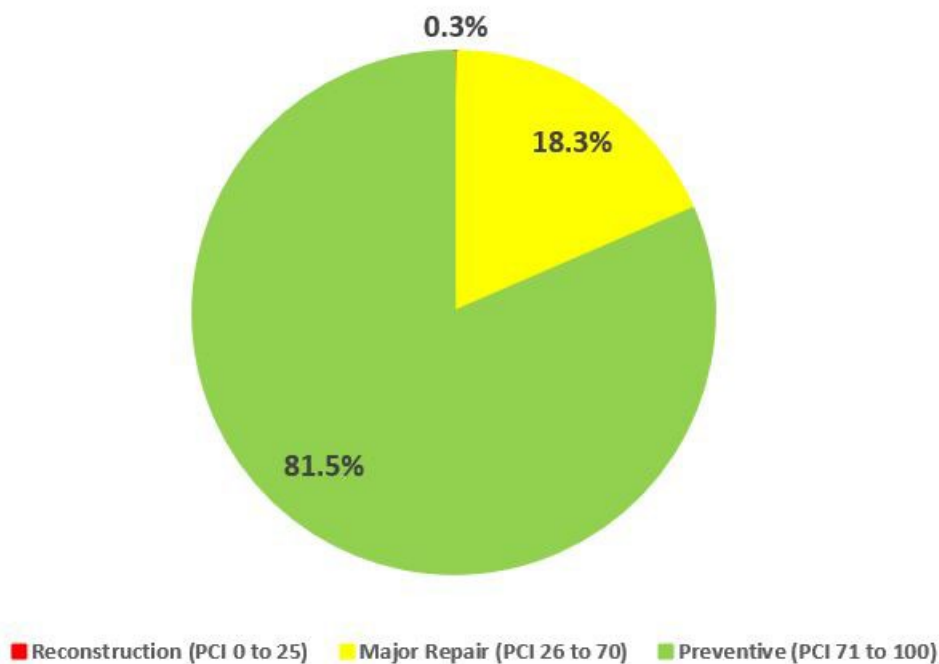

Figure 5 – Repair Needs

E. Conclusion

As was noted after the initial study, we recommend the City continue to have the streets evaluated every two to three years. This allows for the continued monitoring of changing pavement conditions. It also allows the City to see what changes to the system management are positively (or negatively) impacting the system as a whole.

Agenda Item # 3.3

TH65 Bridge Aesthetics

Background

The preliminary design of the bridges at 99th Avenue, 105th Avenue, 109th Avenue, 117th Avenue, and the pedestrian bridge at 113th/114th Avenues are nearly complete. The preliminary design required a Visual Quality Manual to be created that lays out the general Aesthetics treatments of the bridges and the landscaping of the local streets (roundabouts and boulevards). As a starting point for the bridge treatments, there was a review of the bridge colors and textures in the corridor at 121st Avenue/Paul Parkway, 125th Avenue, and 129th Avenue. These colors and textures are listed in the manual on page 4, see attachment. To tie the TH 65 corridor together throughout Blaine, the new bridges would follow similar colors and textures but could customize the abutment wall textures to look or give a sense of location or place. There is a suggestion on page 11 of the manual as a suggestion for the abutment wall textures for each bridge. Please note that the pedestrian bridge was added later to the preliminary design and not included in the Visual Quality Manual but there are a few elements that will include the railing color and the truss color of the bridge beams. Staff will bring back an item in the future to discuss the landscaping elements on the local roads.

Staff Recommendation

Staff is recommending that council discuss the bridges and the proposed textures on the abutment treatments along with the pedestrian bridge color of the railing and support beams.

Questions for Council

Attachment List

1. Blaine TH65 Visual Quality Manual

Blaine TH 65 Visual Quality Manual

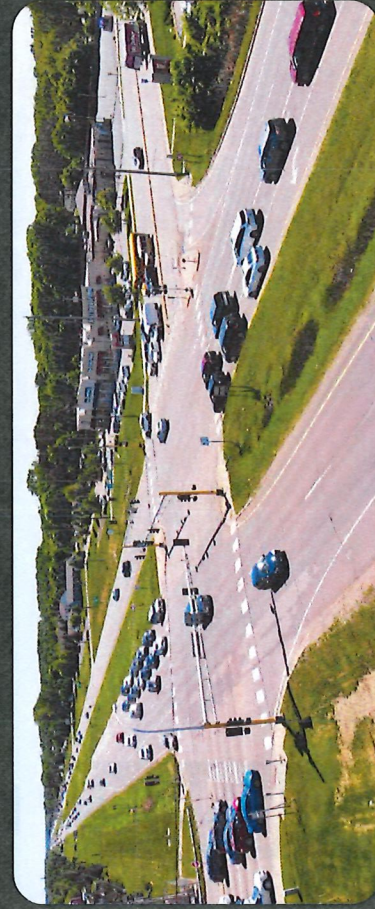

Acknowledgements

This Visual Quality Manual was prepared for the Highway 65 corridor through Blaine, Minnesota. It was primarily prepared by TKDA with assistance from Anoka County, the Minnesota Department of Transportation, and the City of Blaine. Thank you to those who have contributed.

Introduction

Purpose

MnDOT, local agency stakeholders, and the Federal Highway Administration used a Planning and Environmental Linkages (PEL) study to develop and identify recommendations to Highway 65 in Blaine, MN.

Planned Improvements will include:

- Added frontage roads and overpasses
- Changes to access
- Facilities for people walking and biking

The goal of this Visual Quality Manual is to outline aesthetic treatments along the Trunk Highway 65 corridor. Aesthetic treatments include landscaping, concrete patterns, and other treatments. The materials chosen will be visually pleasing, durable, and low-maintenance.

Corridor Issues

Vehicle Safety

Fatal and severe injury crash rates on highway 65 segments are 8 times higher than the state average.

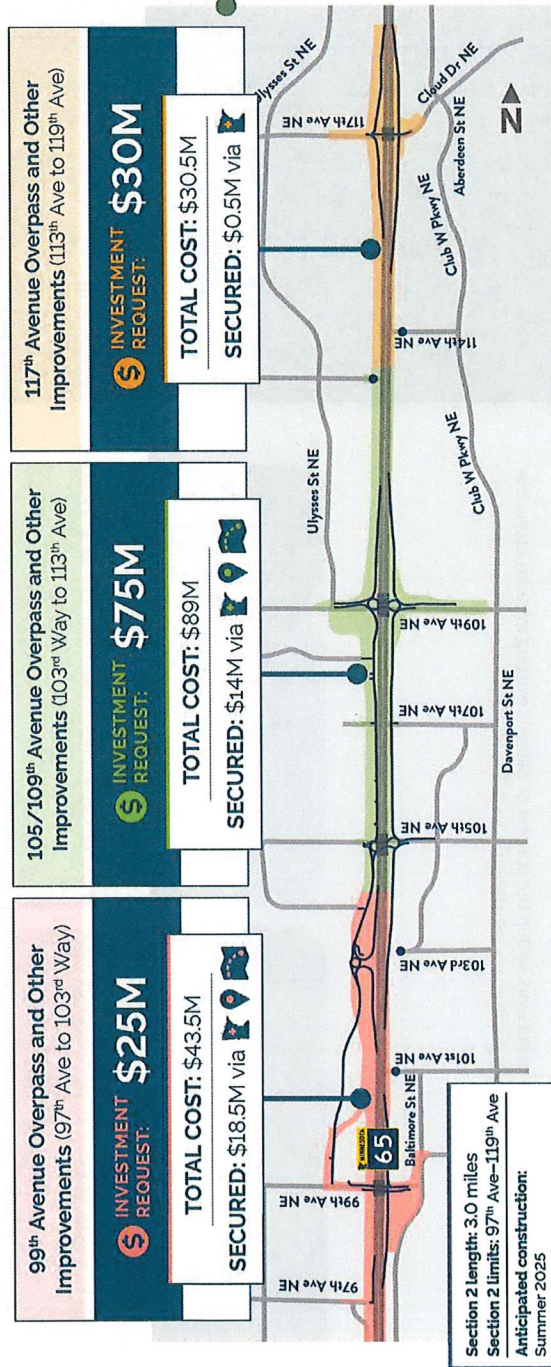

Vehicle Congestion

Congestion is expected to nearly double during peak hour travel times from 24 minutes to 40 minutes from south of County Road 10 to Bunker Lake Blvd by 2045.

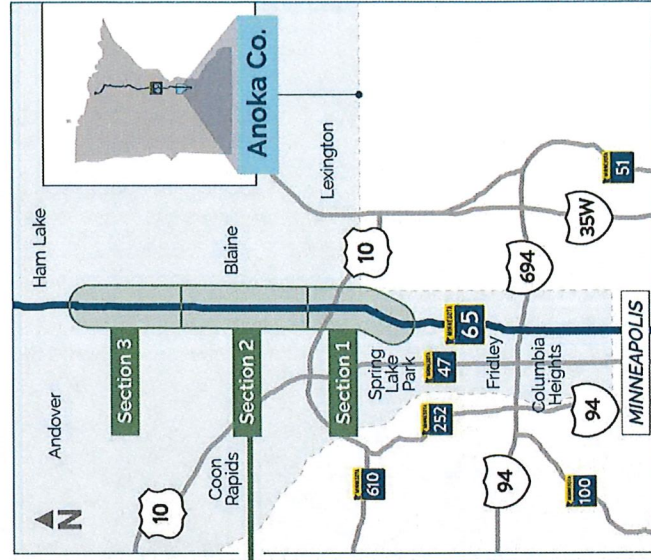

Bike and Pedestrian Safety

Highway 65 is difficult to travel on or cross for people walking and biking.

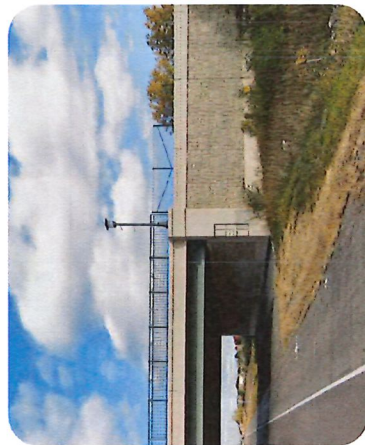

FUNDING SOURCES AND TYPES: State Bonding, Local Road Improvement Program, Regional Solicitation

Conceptual Vision

To ensure that all aesthetic treatments work within the context of Blaine's existing infrastructure, the project shall use materials and designs that are consistent with the existing physical environment in the community.

125th Ave NE From TH65 Facing North

Club W Pkwy NE and 114th Ave

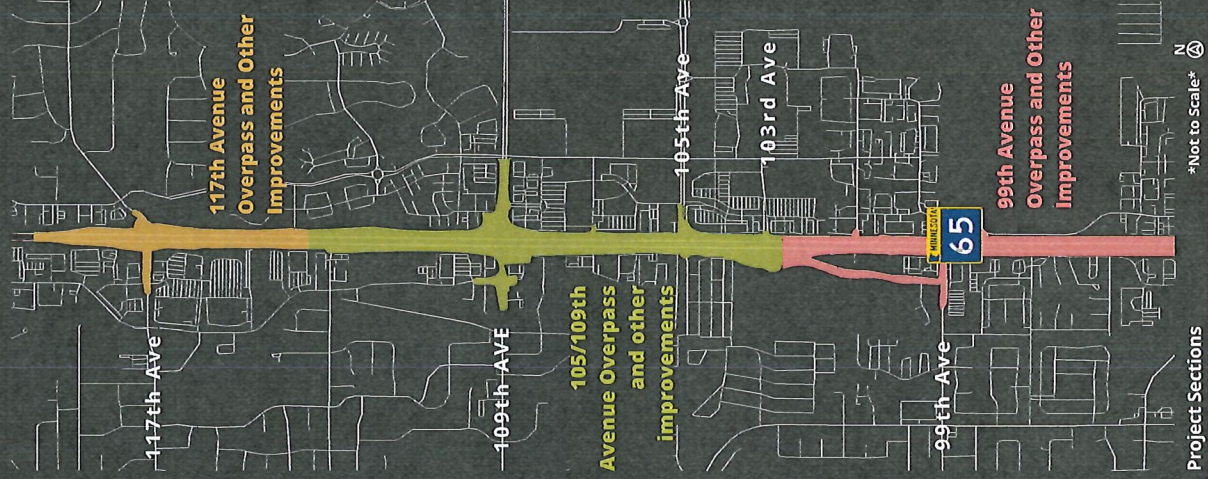

Club Pkwy NE and 113th Ave NE

Project Overview

Section 2 of the project is divided into three parts, named for the major overpass(es) in each section and spans from 97th Ave to 119th Ave.

This report is divided into the following sections:

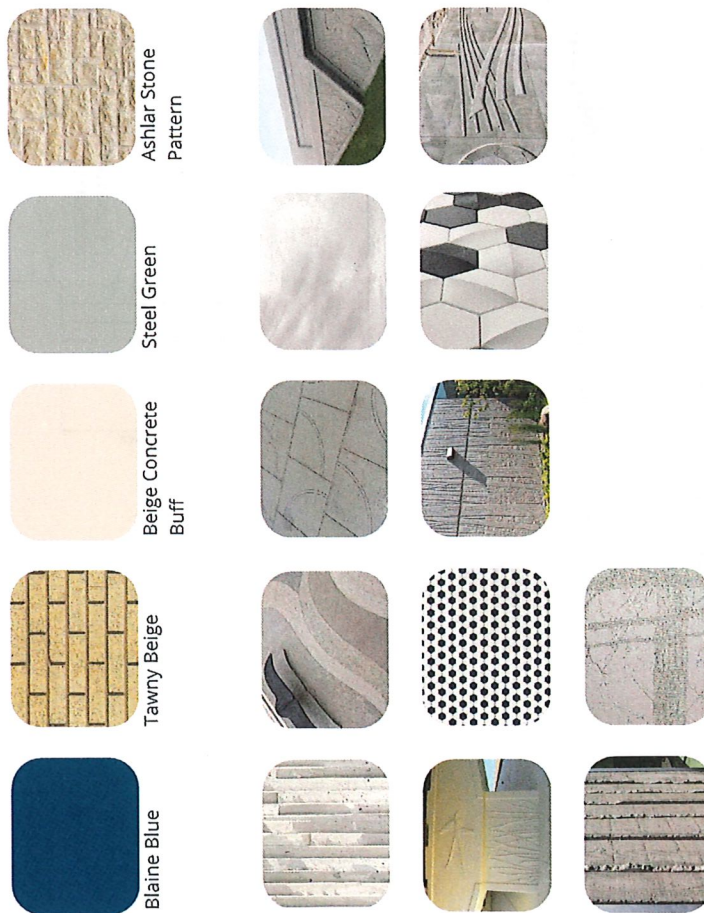

- Bridges
- Roundabouts
- Landscaping

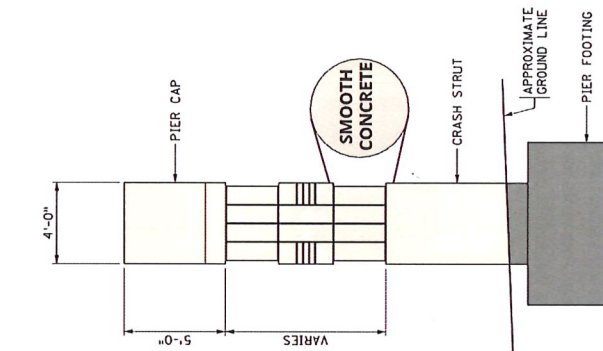

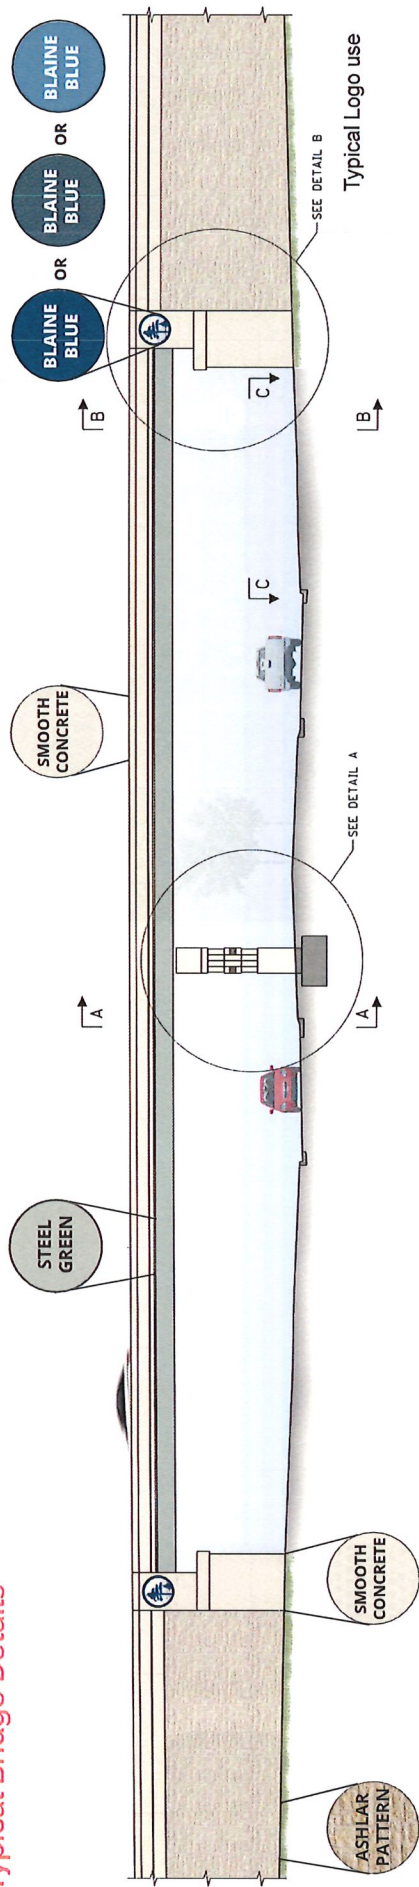

Bridges

The bridge aesthetic treatments provide an opportunity to establish a sense of place that feels uniquely 'Blaine'. The design elements outlined in the following section are intended to continue the existing character in the community while providing strategic moments for customization. Designs should reference the surrounding landscape and provide a visual reference for wayfinding.

Color and Texture Palette:

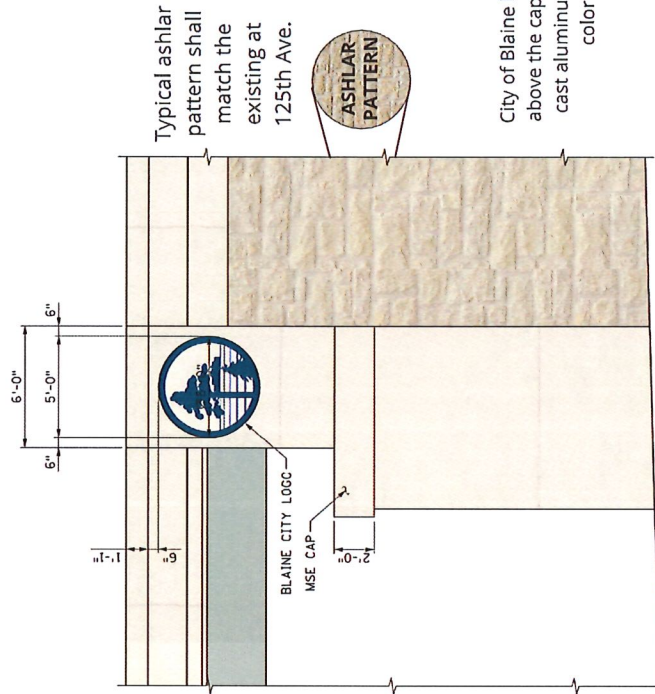

Typical Bridge Details

Typical Pier Elevation

Pier design shall match the existing aesthetics at 125th Ave.

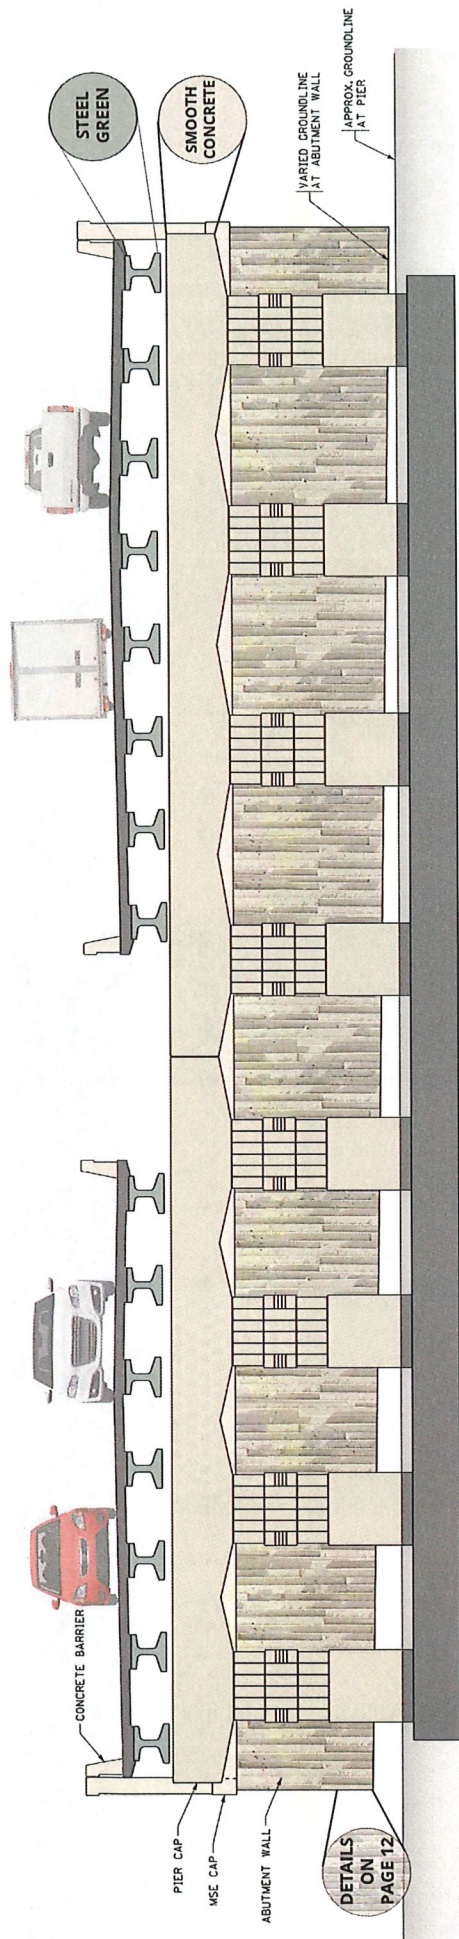

DETAIL B

Typical ashlar pattern shall match the existing at 125th Ave.

Typical Logo use

City of Blaine logo should be fixed to the column above the cap. Material should be made of solid cast aluminum with a powdercoat finish in the color of Blaine's standard blue.

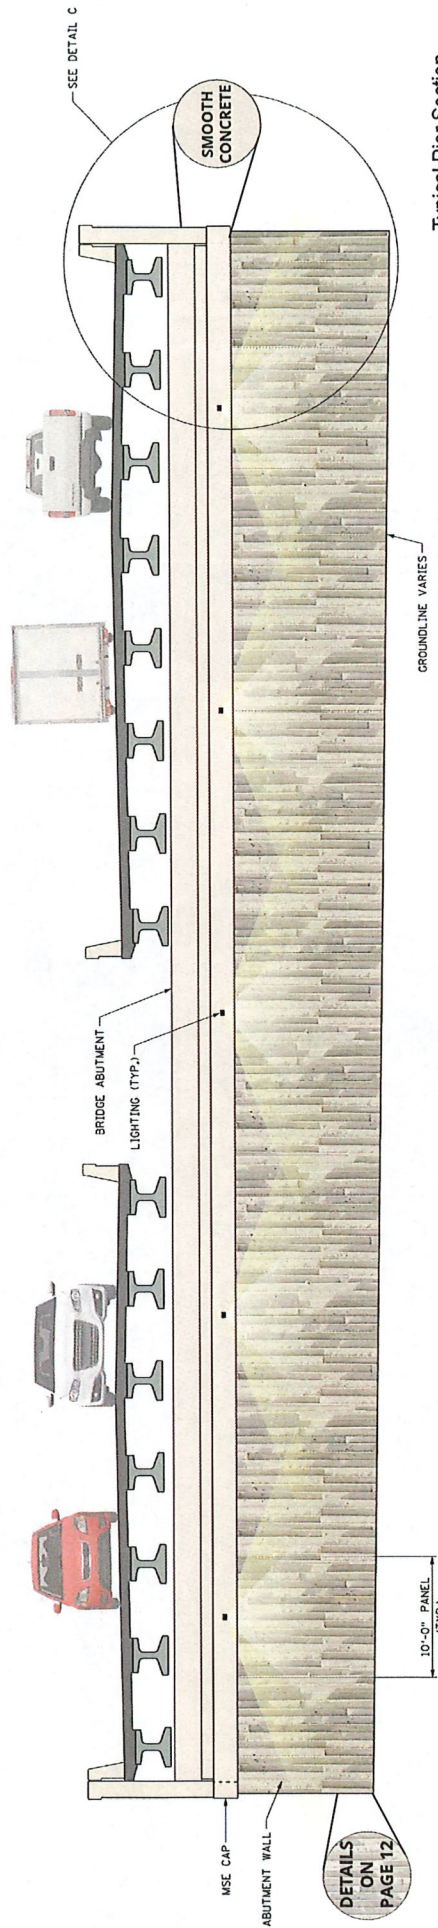

DETAIL A

Typical Pier Elevation

SECTION A-A

The MSE abutment wall shall have a unique concrete pattern as outlined in page 10 of this manual. This pattern shall extend to the top of the wall and beyond the groundline. See page 7 for pier and MSE cap aesthetics.

Typical Pier Section

SECTION B-B

MSE Abutment Wall Details

The MSE abutment walls on each of the four bridges are designed to provide visual connections to each destination. The diagram on the right outlines the design intent and key elements to be included on each bridge.

- **117th Avenue:** This bridge connects Sunrise Lake, Lakeside Commons Park, and West Lake Park to Blaine Baseball Complex and Blaine's City Center. As illustrated to the right, the design of these walls is inspired by the flow and movement of the lakes reached by the 117th Ave bridge.
- **109th Avenue:** Deacons Park, Blaine Wetland Sanctuary off Lexington Ave, and North Oaks West are key destinations along this corridor. The design for the 109th Ave abutment wall is a conceptual interpretation inspired by the wooded areas in these environments.
- **105th Avenue:** The connection to the National Sports Center, a 600 acre world-class multi-sport facility, with this corridor should be represented in the 105th Ave abutment wall design. The soccer-inspired scale pattern layout should be explored to ensure a clear meaning for drivers and pedestrians.
- **99th Avenue:** This bridge connects the community to Olympia Park and Victory Golf Course. The patterns along these walls should be reminiscent of natural, open space including grasses, wildlife and/or sky that can be found in these spaces.

Roundabouts & Site Amenities

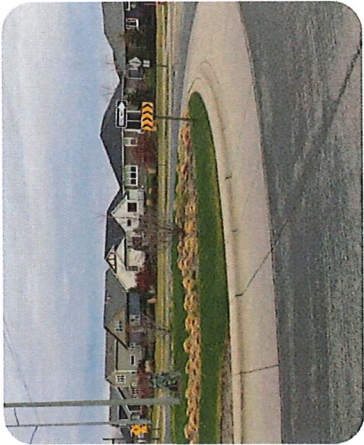

The overall intent is to create a beautiful, low maintenance, resilient landscape that compliments the context of the corridor.

126th Ave NE and Legacy Creek Pkwy NE

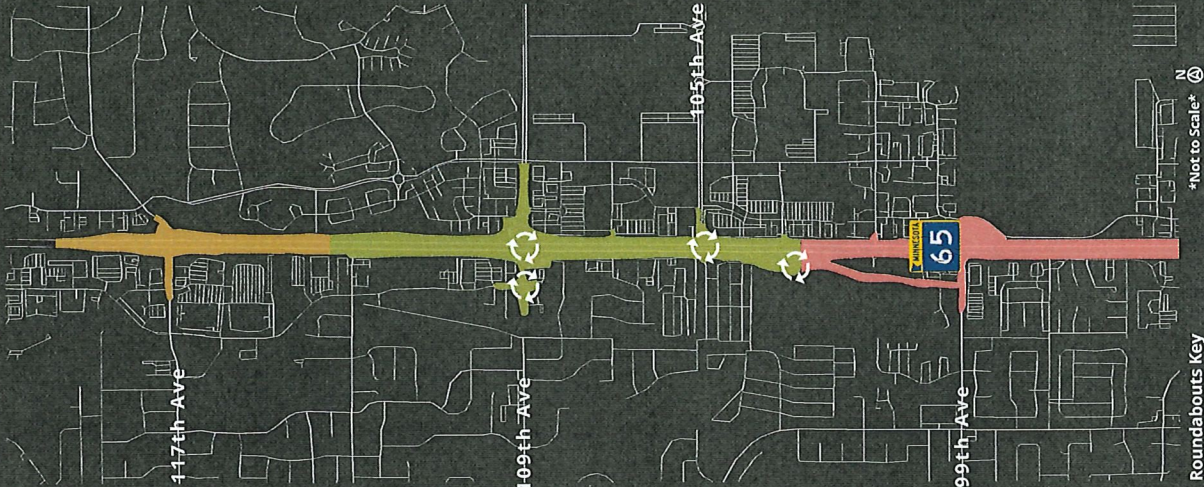

105th Ave NE and National Sports Center

Harpers Ct NE and Lakes Pkwy

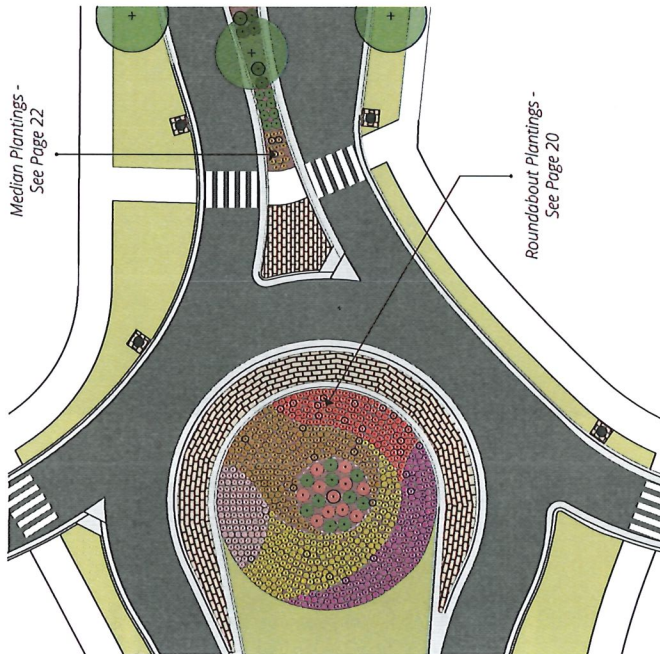

Club W Pkwy NE and 113th Ave NE

Roundabouts Key

Not to Scale

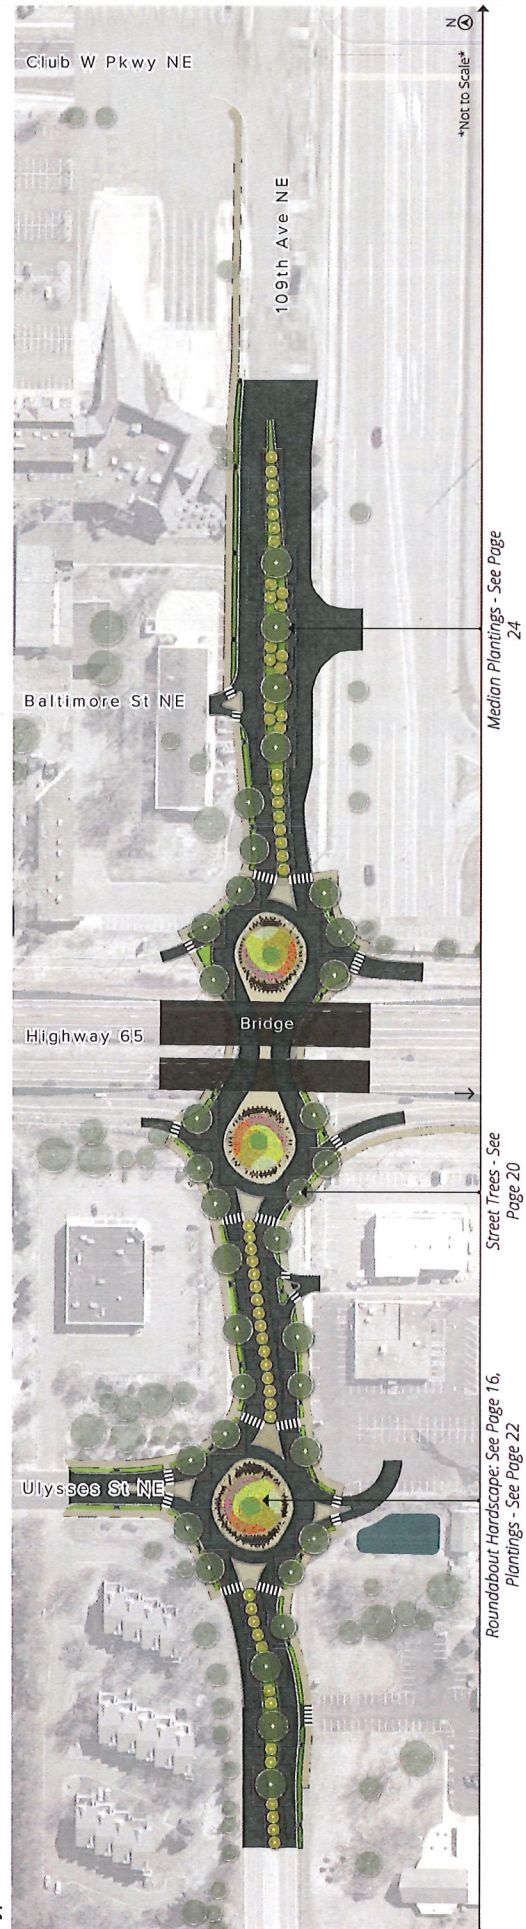

Typical Roundabout Details

Typical Hardscape Design

- All Concrete in medians and truck aprons should be tawny beige and stamped in a brick pattern.
- Lighting Standards:
 - Lights should match existing pedestrian level lamp posts in Blaine.
 - Place 4' X 4' Concrete base, tawny beige, stamped brick.

Typical Roundabout Plan

Landscaping

Planting Strategy:

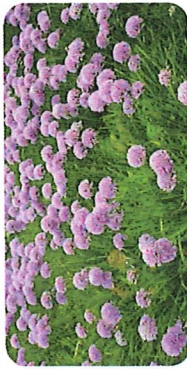

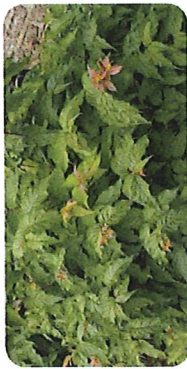

The planting strategy for the TH 65 corridor is based on utilizing low maintenance plantings that are proven to be hardy and salt-tolerant. Plantings should be located strategically along the corridor to provide maximum impact without creating long-term maintenance issues.

Key Guidelines:

The plantings and uses are broken into the following categories:

- Street Trees
- Roundabout Plantings
- Median Plantings

Landscaping should be used at these key locations to ensure maintenance is achievable. Shrubs and perennials should be placed in large masses with tight spacing. Diversity of plant materials is an important factor as well. The species outlined have a proven tolerance to harsh environments and are salt tolerant.

General Plant List

Deciduous Trees

Accolade Elm
Autumn Gold Ginkgo
Bur Oak
Majestic Skies Northern Pin Oak
Northern Acclaim Honey Locust
Ivory Silk Lilac
Summertime Amur Maackia
MN Strain Redbud

Coniferous Trees

Jack Pine
Black Hills Spruce

Shrubs

Black Chokeberry
Dwarf Bush Honeysuckle
Rugosa Rose

Perennials

Prairie Dropseed
Walker's Low Catmint
Stella D'Oro Daylily
Allium 'Summer Beauty'
Autumn Joy Sedum

Ulmus 'Morton' Accolade
Ginkgo biloba 'Autumn Gold'
Quercus macrocarpa
Quercus elipsoidalis 'Balsiques'
Gleditsia triacanthos 'Harve'
Syringa reticulata 'Ivory Silk'
Maackia amurensis 'Summertime'
Cercis canadensis 'Minnesota Strain'

Pinus banksiana
Picea glauca var. densata

Aronia melanocarpa
Diervilla lonicera
Rosa rugosa

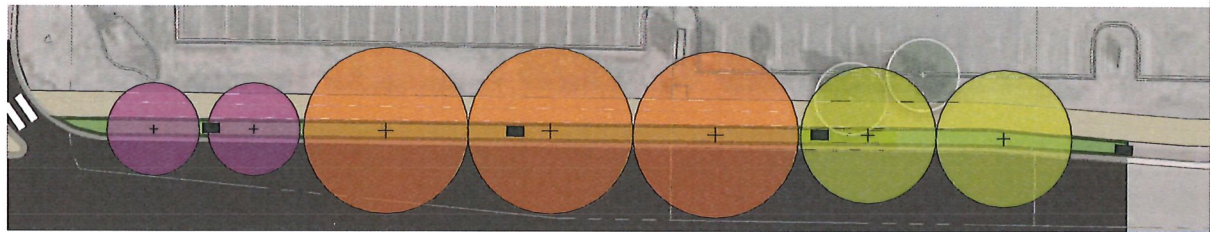

Sporobolus heterolepis
Nepeta x faassenii 'Walker Low'
Hemerocallis Stella D'Oro
Allium 'Summer Beauty'
Sedum 'Autumn Joy'

Street Trees

Street trees will create a more comfortable environment for pedestrians and bicyclists. Trees should be located on the city streets, not along the interchanges or Trunk Highway 65.

Diversity in tree species is a key priority. The same species of tree should not be planted in groups larger than 3-5. Spacing of the trees should be appropriate for the species at full maturity.

15' MN Strain
Redbud

40' O.C. Bur Oak

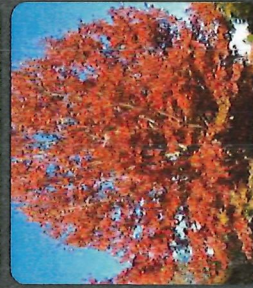

30' O.C. Autumn
Gold Ginkgo

Street Tree Planting List

Deciduous Trees

Accolade Elm	<i>Ulmus 'Morton' Accolade</i>	Spacing
Autumn Gold Ginkgo	<i>Ginkgo biloba 'Autumn Gold'</i>	40' O.C.
Bur Oak	<i>Quercus macrocarpa</i>	30' O.C.
Majestic Skies Northern Pin Oak	<i>Quercus elipsoidalis 'Bailskies'</i>	40' O.C.
Northern Acclaim Honey Locust	<i>Gleditsia triacanthos 'Harve'</i>	30' O.C.
Ivory Silk Lilac	<i>Syringa reticulata 'Ivory Silk'</i>	15' O.C.
Summertime Amur Maackia	<i>Maackia amurensis 'Summertime'</i>	15' O.C.
MN Strain Redbud	<i>Cercis canadensis 'Minnesota Strain'</i>	15' O.C.

Roundabout Plantings

The planting strategy for roundabouts is to use large mass plantings of native, low-maintenance, salt tolerant shrubs and perennials.

Roundabout Planting List

Shrubs

Dwarf Bush Honeysuckle
Rugosa Rose

Spacing

3' O.C.
4' O.C.

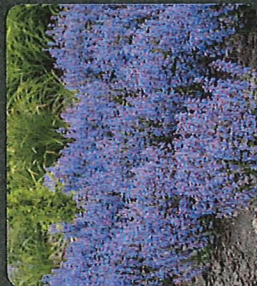

Diervilla lonicera
Rosa rugosa

Perennials

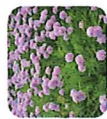

Prairie Dropseed
Walker's Low Catmint
Stella D'Oro Daylily
Allium 'Summer Beauty'
Autumn Joy Sedum

Sporobolus heterolepis
Nepeta x faassenii 'Walker Low'
Hemerocallis Stella D'Oro
Allium 'summer beauty'
Sedum 'Autumn Joy'

1.5' O.C.
3' O.C.
2' O.C.
2' O.C.
2' O.C.

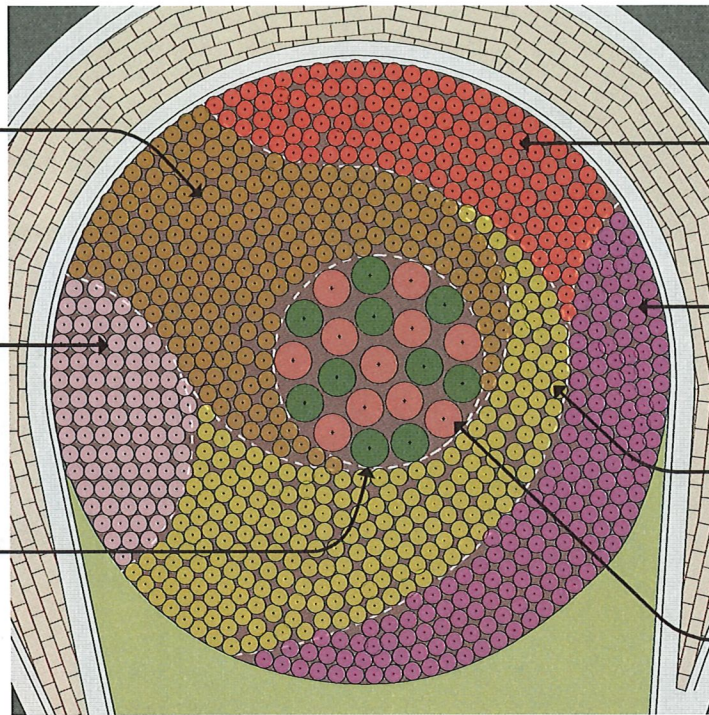

Prairie Dropseed

Allium Summer Beauty

Dwarf Bush Honeysuckle

Autumn Joy Sedum

Walker's Low Catmint

Stella D'Oro Daylily

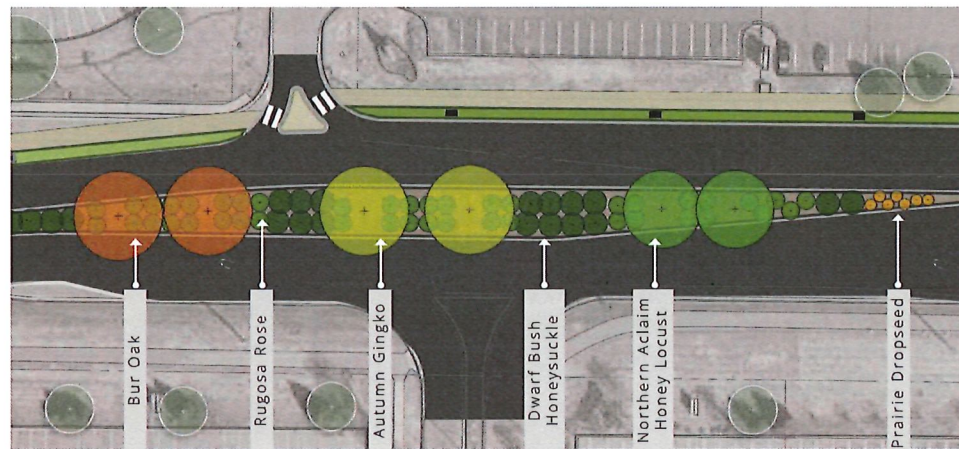

Prairie Dropseed

Median Plantings

The median plantings are placed in a pattern to create texture and movement, while still maintaining order and hierarchy.

Trees are located in the center; plants get shorter and smaller towards the end of the medians.
